# 1 Installation

Install the **SGS Prime COGO** application for HP Prime on any of the following devices:

- ▶ Physical HP Prime Graphing Calculators
- ▶ Virtual Calculators for [Windows or Mac](#)
- ▶ Windows UWP [HP Prime Pro](#) app
- ▶ Android [HP Prime Pro](#) app
- ▶ iOS [HP Prime Pro](#) app

**Required:** Installation requires the Connectivity Kit for [Windows or Mac](#).

## 1.1 New Installation

Step	Action
1	Download the installation files from <a href="https://sgss.ca/hpprime.html">https://sgss.ca/hpprime.html</a> .
2	Unzip/extract the installation files.
3	Navigate into the folder where the files were extracted, a folder  <code>SGSPrimeCOGO_v1_6_0_en</code> with the version number of the app will be found.
4	Open the folder to reveal a sub-folder with a <b>.hpappdir</b>  <code>SGS Prime COGO.hpappdir</code> extension inside.
5	Open the Connectivity Kit on your PC or Mac.
6	A. For physical HP Prime calculators; plug in the USB cable to connect. B. For HP Prime Pro apps; open the app on the device that is on the same Wi-Fi network as the PC or Mac running the Connectivity Kit.
7	Confirm your calculator connection, it will be visible in the  pane of the Connectivity Kit once connected.

8

Expand the connected calculator in the Connectivity Kit.

Drag and Drop the  **SGS Prime COGO.hpappdir** folder from Step 4 onto the

▼  **Application Library** folder of your calculator. It may take a few seconds to complete the transfer.

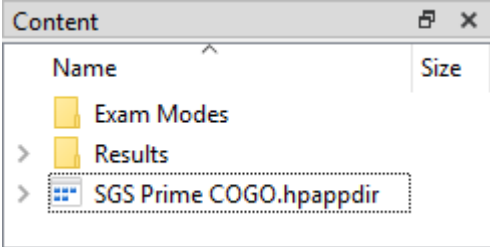

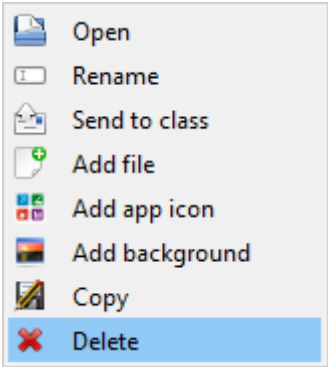

Close the Connectivity Kit.

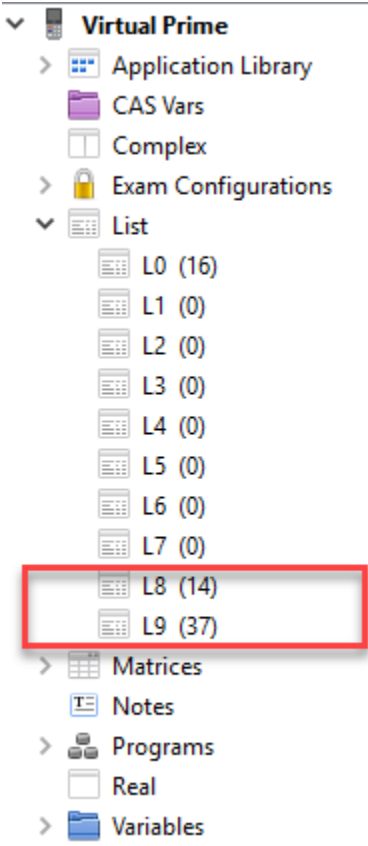

## 1.2 Upgrade to new Version

To preserve application variables and files, it is best to overwrite only the program code of the app when upgrading to a newer version. It is currently not possible to overwrite just the program code of an app directly in the **Application Library**; therefore, a workaround step is required to accomplish the upgrade.

Step	Action
1	Download the installation files from <a href="https://sgss.ca/hpprime.html">https://sgss.ca/hpprime.html</a> .
2	Unzip/extract the installation files.
3	Navigate into the folder where the files were extracted, a folder  <b>SGSPrimeCOGO_v1_6_0_en</b> with the version number of the app will be found.
4	Open the folder to reveal a sub-folder with a <b>.hpappdir</b> extension inside.  <b>SGS Prime COGO.hpappdir</b>
5	Open the Connectivity Kit on your PC or Mac.
6	A. For physical HP Prime calculators; plug in the USB cable to connect. B. For HP Prime Pro apps; open the app on the device that is on the same Wi-Fi network as the PC or Mac running the Connectivity Kit.
7	Confirm your calculator connection, it will be visible in the <b>Calculators</b>   pane of the Connectivity Kit once connected.
8	<p>Expand the  <b>Application Library</b> folder and locate the  <b>SGS Prime COGO</b> app. Drag and drop the app into the <b>Content</b>   pane of the Connectivity Kit.</p> <p>This will create an <b>SGS Prime COGO.hpappdir</b> folder in the <b>Content</b> pane as shown.</p> 
10	<p>Right-click on the  <b>SGS Prime COGO</b> app in the  <b>Application Library</b> and choose <b>Delete</b>.</p> 

11	<p>Using your PC or Mac File Explorer, open the  <b>SGS Prime COGO.hppppdir</b> folder from Step 4.</p> <p>Inside you will find a  <b>SGS Prime COGO.hppppprgm</b> file, drag and drop this file onto the  <b>SGS Prime COGO.hppppdir</b> folder in the <b>Content</b>   pane.</p> <p>At the prompt choose <b>Yes</b> to replace the file.</p> <p>This updates the program code of the app in the <b>Content</b> pane.</p>
12	<p>Drag and Drop the  <b>SGS Prime COGO.hppppdir</b> folder from the <b>Content</b>   pane to the  <b>Application Library</b> folder.</p> <p>It may take a few seconds to complete the transfer.</p> <p>Close the Connectivity Kit.</p>
13	<p>NOTE: If you are upgrading from Version 1.5.x, you can delete the L8 and L9 lists that were installed with that version.</p> <p>Right-click on the L8 and L9 list objects and choose “Delete”.</p> <div data-bbox="1047 709 1412 1549">  <p><b>Virtual Prime</b></p> <ul style="list-style-type: none"> <li>&gt; Application Library</li> <li>CAS Vars</li> <li>Complex</li> <li>&gt; Exam Configurations</li> <li>&gt; List <ul style="list-style-type: none"> <li>L0 (16)</li> <li>L1 (0)</li> <li>L2 (0)</li> <li>L3 (0)</li> <li>L4 (0)</li> <li>L5 (0)</li> <li>L6 (0)</li> <li>L7 (0)</li> <li><b>L8 (14)</b></li> <li><b>L9 (37)</b></li> </ul> </li> <li>&gt; Matrices</li> <li>Notes</li> <li>&gt; Programs</li> <li>Real</li> <li>&gt; Variables</li> </ul> </div>

**NOTE:** If you encounter an Insufficient Memory error when trying to connect with the Connectivity Kit, try:

1. Reboot the calculator by holding down  and then pressing . Try again.
2. If you have Version 1.5.1 or later installed, try the **Unload** option prior to connecting to the Connectivity Kit, then use the **Reload** option after upgrade is complete.

## 1.3 Running SGS Prime COGO

Once installed, run **SGS Prime COGO** by one of the following methods:

1. Open the Application Library on your calculator by using the **Apps Info** key. Locate the **SGS Prime COGO** app and tap the icon or **Start** on the menu to open the application.

2. From the Home or CAS screen, if **SGS Prime COGO** is the active application with the title visible at the top of the screen, use the **Num** key to start the application.

Other shortcut keys available from the Home or CAS screen:

- ▶ **Symb** key starts the [RPN Calculator](#).
- ▶ **Plot** key opens the [Plot Points](#) program.
- ▶ **Shift** and **Symb** / **Plot** / **Num** keys opens the [User Settings](#) options.

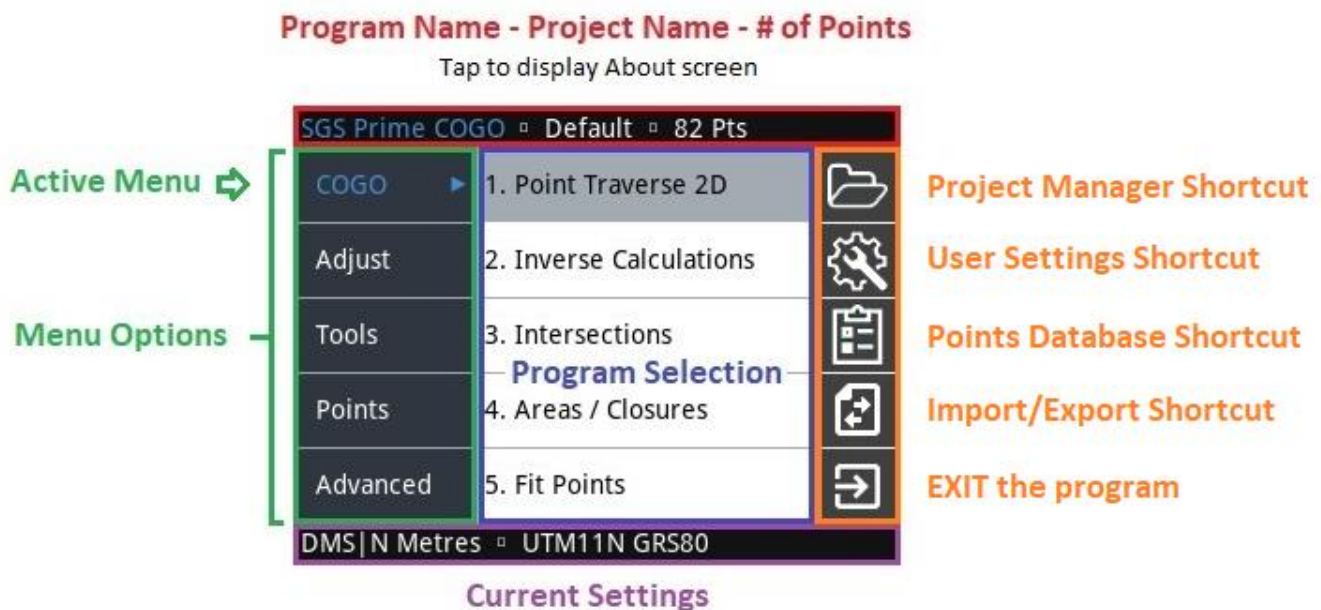

## 2 Main Menu and User Interface

SGS Prime COGO is designed for touch and keyboard navigation.

### 2.1 Main Menu Screen

The user interface displays program settings and provides access to all program functions. The diagram below illustrates the screen layout.

See the next two pages for descriptions of the various components.

Item	Description
<b>Project Name</b>	Displays the current project name and the number of points stored in the current project. NOTE: Tap on this area to display the <b>About</b> screen.
<b>Shortcuts</b>	Often used functions are available on all main interface screens.
<b>Current Project</b>	Displays some of the available user settings. <ul style="list-style-type: none"> <li>▶ <b>DMS</b> (360° ‘ ‘’) <b>D.d°</b> (360° decimal) <b>GON</b> (400 gons) indicates current Angle Unit setting.</li> <li>▶ <b> N</b> (North Bearings) <b> S</b> (South Bearings) <b> QB</b> (Quadrant Bearings) indicates current direction reference setting.</li> <li>▶ <b>Metres</b> (Metres) <b>IFeet</b> (International Feet) <b>USFeet</b> (US Survey Feet) indicates the current Distance Unit setting.</li> <li>▶ Coordinate system and associated ellipsoid.</li> </ul>
<b>Menu Options</b>	Displays the titles of all menus, with the active menu name highlighted. <ul style="list-style-type: none"> <li>▶ <b>COGO</b> menu</li> <li>▶ <b>Adjust</b> menu</li> <li>▶ <b>Tools</b> menu</li> <li>▶ <b>Points</b> menu</li> <li>▶ <b>Advanced</b> menu</li> </ul>
<b>Program Selection</b>	Displays the available programs within each menu, with the currently selected program name highlighted.

About Screen

Tap the top of the main menu to display the About screen. The program version and license information is shown.

**Key** Update License Key. This will be necessary when upgrading an existing license from Lite to Standard, or Standard to Professional.

**Unload** Unload app data to reduce the memory size of the app folder. **Warning:** This removes all user-created content from the app and is intended for use prior to performing an app upgrade to a new version.

**Reload** Reload previously unloaded app data. Intended to be used immediately after performing an app upgrade to a new version.

Project Manager Shortcut

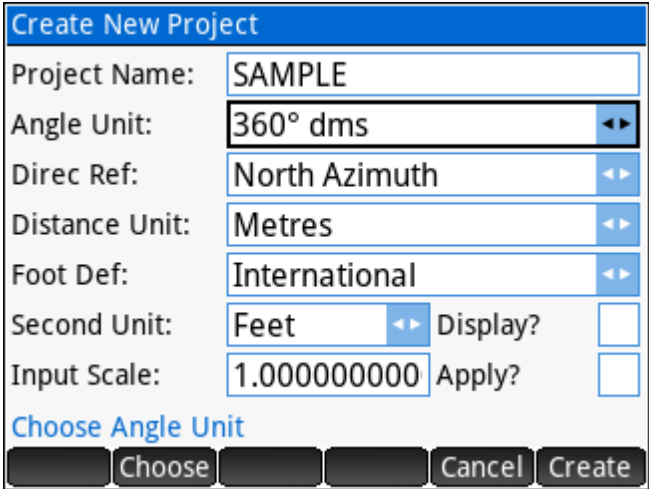

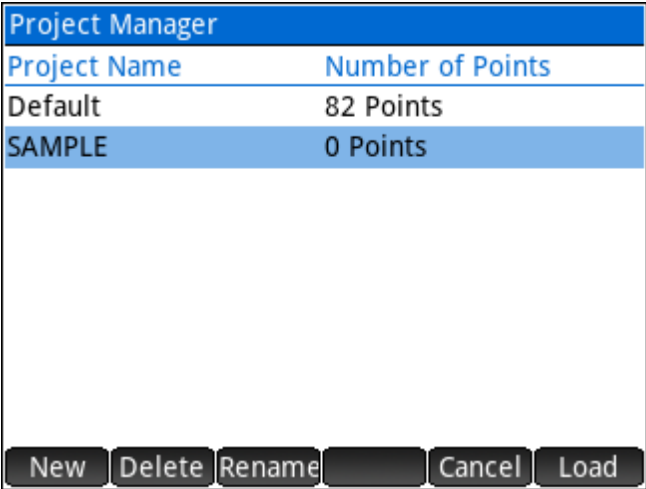

Tap to access the Project Manager. Available options:

**New** Create a new Project. The name is entered, and common user settings are selected. Some of the User settings are stored with each project while others are applied to all projects; see the [User Settings](#) chapter for details.

**Delete** Delete the selected project. A confirmation prompt is displayed.

**Rename** Rename the selected project.

**Load** Load the selected project.

User Settings Shortcut

Tap to access the User Settings. See the [User Settings](#) chapter.

Points Database Shortcut

Tap to access the current project Points Database.

Points are sorted in numerical ascending order.

Available options:

- Edit** Edit the selected Point coordinates and description.
- Find** Find a point by Point ID.
- ▼ Page** Page Down, scrolls to the next page until the end of the database is reached.
- Page ▲** Page Up, scrolls to the previous page until the start of the database is reached.

Points Database				
Point ID	North	East	Elev	Desc
23	2096.000	1086.000	0.000	SLIDE
24	2089.000	1089.000	0.000	SLIDE
25	2090.000	1099.000	0.000	SLIDE
31	120.000	220.000	0.000	HINGE
32	130.000	220.000	0.000	HINGE
33	130.000	210.000	0.000	HINGE
34	111.000	203.000	0.000	HINGE
35	109.000	208.000	0.000	HINGE
41	7444.140	5354.860	0.000	FIT_CURVE
Edit Find ▼ Page Page ▲ Cancel OK				

Find Points

Enter a Point ID to display the coordinates and description of the Point ID. Scroll to view information of the adjacent points, as sorted numerically.

While viewing point information:

- Edit** Edit the currently displayed point.
- Cancel** Exit the Find Points program and return to the Main Menu.
- OK** Return to the Input Form.

Find Point

EditCancelOK

## 2.2 Keyboard

Navigate the main user interface by using the directional cursor keys. Use the ◀ and ▶ cursor keys to change the current menu and use the ▲ and ▼ cursor keys to change the current selection.

- ▶  will load the currently selected program.
- ▶  or  will exit **SGS Prime COGO**.
- ▶ Numeric keys  through  can be used to run the corresponding program from each menu.
- ▶  launches the [RPN Calculator](#) app from the Main Menu or from any Input Form.
- ▶  opens the [Plot Points](#) program.
- ▶  opens the Points Database.

## 2.3 Input Forms

Input forms are used throughout the program to accept multiple different types of input. Some common input types are: **Point IDs / Point Ranges / Directions / Angles / Distances / Coordinates / Stations / Grades / Text / Choose Lists / Checkboxes**

The diagram illustrates the 'Export ASCII Points' input form with the following components labeled:

- Title:** Export ASCII Points
- Field Labels:** Format, Delimiter, Decimals, File Name, Point(s), All Points
- Input Fields:** P·N·E·Z·D, Comma, 4, Default, .csv
- Page Selections:** ASCII, DXF, KML
- Checkbox:** All Points
- Help Text:** Enter Point(s) to Export (#..#, #, #..#)
- Menu:** Edit, Cancel, Export

Each input form will have some of the same basic elements, such as the Title, Field Labels, Input Fields, Help Text and a Menu. Some input forms feature more than one page, the page selections can be made on the right edge of the screen. The touch screen and keyboard can be used to select fields.

Current display settings control the appearance of each field.

NOTE: The [RPN Calculator](#) app can be launched from any input form by using the  key.

### Copy and Paste

The clipboard can hold multiple items, which are stored as strings as would be entered into an input field.

 and  can be used to copy the value inside the selected field, or the value being edited.

 and  can also be used to paste from the clipboard.

The Copy/Paste functionality is a good method to transfer calculated values to/from an Input Form and the [RPN Calculator](#).

The screenshot shows the 'SELECT FROM CLIPBOARD' dialog with the following items:

1. 61.060888753
2. 12.2766203519
3. 57.14
4. 46347
5. 259.255739271
6. 2466.542445
7. 1537.451158

Buttons at the bottom: Delete, Cancel, OK

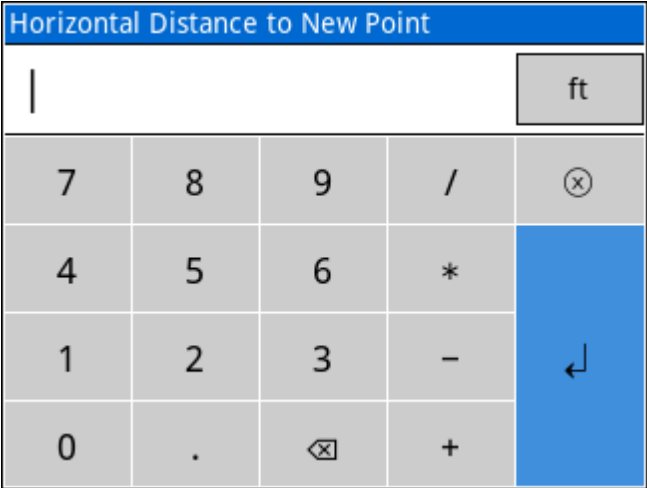

Touchscreen keypads

When any editable input field is selected, tap on the field to open the touchscreen keypad to enter a value. There are two types of keypads, numeric and alpha-numeric.

Numeric keypad

Any time a numeric field is edited, the numeric keypad opens. The title of the keypad is the help text of the field being edited, and a “helper” button is to the right of the edit line, which can vary depending on the type of input field you’re editing. The example shows a distance field being edited, as a result the helper button shows the secondary distance unit to convert from secondary to primary distance units.

Copy and paste is functional here too, as are the keys on the keyboard of the calculator.

Alpha-numeric keypad

Any time an alpha-numeric field is edited, the alpha-numeric keypad opens. The title of the keypad is the help text of the field being edited.

This keypad can have three different sets of characters:

- Uppercase alphabetic (with top row of numbers)
- Lowercase alphabetic (with top row of numbers)
- Numbers and special characters

The **ALPHA** and **Shift** keys can be used to switch between modes.

Depending on the language of the installed app, the keypad may respond to long presses on certain keys to show accent characters where applicable.

Point IDs

A single Point ID can be input by simply entering the number. Depending on the context of where the input is requested, there may be requirements that the point exists or does not exist.

While editing a Point ID field where an existing Point is required, the menu will change to display **Browse** on the first menu label. Pick this option to open the Point Database browser where a Point can be selected from the database.

Point Traverse – Plus

From Point:3

Mode:Traverse

Offsets:

Start Calculation From Point

Browse

Cancel

OK

Point Ranges

To input a range of points:

- ▶ Enter a range of points in the format “From..To”, for example **1..5**, to input a range of point numbers.
- ▶ Enter a combination of point ranges and individual points, for example **1..5 7 9..15**, where each range or individual point is separated by a space or comma.
- ▶ Often a checkbox labeled **All Points** is available to select all points in the current project.

Rotate Points

Point(s):10..15

Directions

A direction input can be a full circle bearing or a quadrant bearing. The prompt will depend on the [direction reference](#) user setting.

- ▶ Enter a 360° full circle bearing input in the DDD.mmss format. For example, 123°45’12” is entered as **123.4512**.
- ▶ Enter a quadrant bearing input in the QDD.mmss format, where Q is the quadrant (1 to 4). For example, N24°34’55”W is entered as **424.3455**.
- ▶ Enter two points in the “From..To” format to inverse the direction between two existing points in the job database. For example, enter **1..2** to inverse the direction from Point 1 to Point 2.

Point Traverse – Plus

Bearing 1:10.11

Offset:0.000m

Direction from Point 1203 (Blank if unknown)

QB→B

±180°

Rad

Cancel

OK

- ▶ Subtract or add angles to/from a line direction by entering “From..To+Angle” or “From..To-Angle”. For example, **1..2+30.3055** will inverse the direction from Point 1 to Point 2 and add 30°30’55” to it.
- ▶ Perform complex calculations using standard algebraic entry with current angle unit settings. For example, **1..2+30.17-2.35-1.44** will inverse the direction from Point 1 to Point 2, then add 30°17’, then subtract 2°35’, and then subtract another 1°44’.
- ▶ Repeat the last entry by entering **++** as input.
- ▶ **QB→B** While editing a direction field, pick this option to convert between quadrant bearings and full circle bearings.
- ▶ **±180°** While editing a direction field, pick this option to reverse the direction.
- ▶ **Rad** While editing a direction field, pick this option to enter a value in radians.

## Angles

Angles work in a similar fashion as directions except that the input MUST be a real number or a complex calculation involving only real numbers.

## Distances

Distance input is like direction input:

- ▶ Enter two points in the “From..To” format to inverse the distance between two existing points in the job database. For example, enter **1..2** to inverse the distance from Point 1 to Point 2.
- ▶ Subtract or add a distance from a line distance by entering “From..To+Distance” or “From..To-Distance”. For example, **1..2+30.1** will inverse the distance from Point 1 to Point 2 and add 30.1 units to it.
- ▶ Divide or multiply a line distance by a factor by entering “From..To\*Factor” or “From..To/Factor”. For example, **1..2/5** will inverse the distance from Point 1 to Point 2 and divide the result by 5.
- ▶ Perform complex calculations using standard algebraic entry. For example, **1..2+(30.214/3)-5** will inverse the distance from Point 1 to Point 2, then add one third of 30.214, then subtract 5.
- ▶ Repeat the last entry by entering **++** as input.
- ▶ **ft** While editing a distance field, pick the first menu button to convert a distance entered from the secondary distance unit to the primary distance unit.

Point Traverse - Plus

Distance 1: 15.24

Distance from Point 1203 (Blank if unknown)

ft [ ] [ ] [ ] Cancel OK

## Feet, Inches, Fractions

Feet, Inches and fractions may be input into any distance fields by delimiting each part by a comma character. This input type will always convert to the current unit setting once entered. The tables below show example use cases to illustrate how this entry method is implemented.

### Project Distance Unit set to Metres

User Entered Value	Interpreted As	Displayed As (3 decimal places)
10	10m	10.000m
10,	10'	3.048m
10,6	10'-6"	3.200m
10,6,1/2	10'-6 1/2"	3.213m
10,6,15/32	10'-6 15/32"	3.212m
10,6,7	10'-6 7/16"	3.212m

### Project Distance Unit set to Feet

User Entered Value	Interpreted As	Displayed As (1/16 precision)
10	10'	10'
10,	10'	10'
10,6	10'-6"	10'-6"
10,6,1/2	10'-6 1/2"	10'-6 1/2"
10,6,15/32	10'-6 15/32"	10'-6 1/2"
10,6,7	10'-6 7/16"	10'-6 7/16"

## Coordinates

Coordinate values must be entered as real numbers, or as complex calculation involving real numbers. Coordinates are displayed with current unit suffix once entered.

## Stations

Station values must be entered as real numbers, or as complex calculation involving real numbers. Stations are displayed with current station format once entered, 0+00 / 0+000 / No Format.

## Grades

Grade values must be entered as real numbers, or as complex calculation involving real numbers. Grades are displayed with grades format once entered, % (V/H\*100) / Ratio V:H / Ratio H:V.

## Text

Text fields will accept a certain range of characters as valid input. Use  and  to enter the characters required. Available characters include (see next page):

Default	1 2 3 4 5 6 7 8 9 0 . , + - * /
<b>ALPHA</b> alpha enabled:	A B C D E F G H I J K L M N O P Q R S T U V W X Y Z # : . ;
<b>ALPHA</b> alpha and <b>Shift</b> enabled:	a b c d e f g h i j k l m n o p q r s t u v w x y z # : = _ ;

## Choose Lists

Choose lists contain a pre-defined set of options to choose from. Selections can be made by:

- ▶ Tapping on the field to open the list of possible selections to pick.
- ▶ Tapping **Choose** once the field is selected.
- ▶ Cycling through available options using the keyboard ◀ and ▶ buttons.

The current selection is displayed with a checkmark when the list is expanded.

## Checkboxes

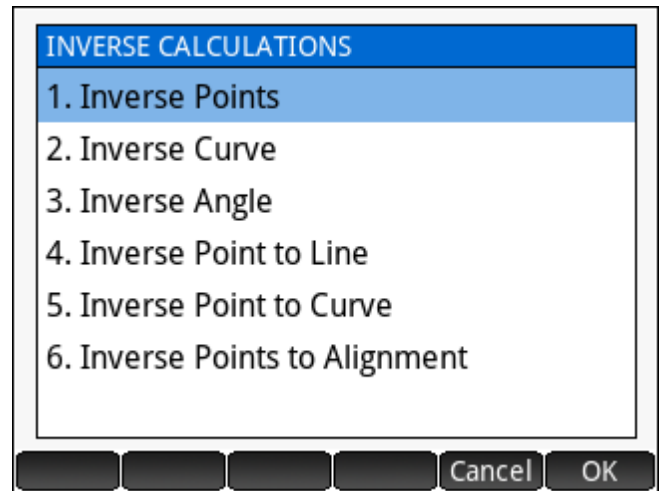

Checkboxes are toggles to set a flag True or False. In some cases, the state of the checkbox may disable or enable other fields in the input forms. Checkboxes can be toggled by:

- ▶ Tapping on the field.
- ▶ Tapping **✓** once the field is selected.
- ▶ Using the keyboard ◀ and ▶ buttons.

## 2.4 Choose Boxes

Choose boxes present a list of multiple options from which to choose. Selections can be made by:

- ▶ Tapping on the option row selects the option, and when already selected will complete the selection and advance to the next step.
- ▶ Use the keyboard shortcut keys  to  to make a selection. This action will also complete the selection and advance to the next step.
- ▶ Cycling through available options using the keyboard  and  buttons. Use  to advance to the next step.
- ▶ When a list is longer than 7 items, a scrollbar is shown and the list can be scrolled with the touchscreen.

## 2.5 Output Screens

Output screens display the results of calculations and do not accept input. Some output screens feature a menu to provide access to further calculations related to the data, while other output screens will only feature a  menu option.

Some output screens consist of multiple pages; the active page is differentiated with a filled circle character preceding the menu label, for example .

Many output screens also feature a  menu button. This allows the user to select one of the solved values to copy to the clipboard.

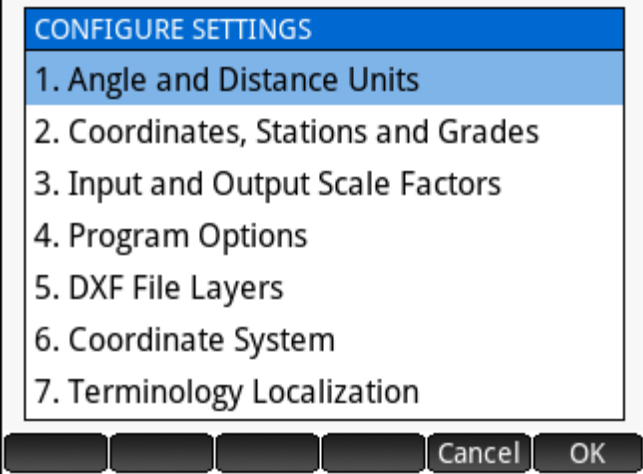

Many output screens also feature a  menu button. This allows the user to select one of the solved values to store to a named variable.

## 3 User Settings

Various settings allow the user to configure the software to function to his/her preference. It is important to review all the settings prior to using the software to ensure they are set to produce the desired results.

### 3.1 Angle and Distance Units

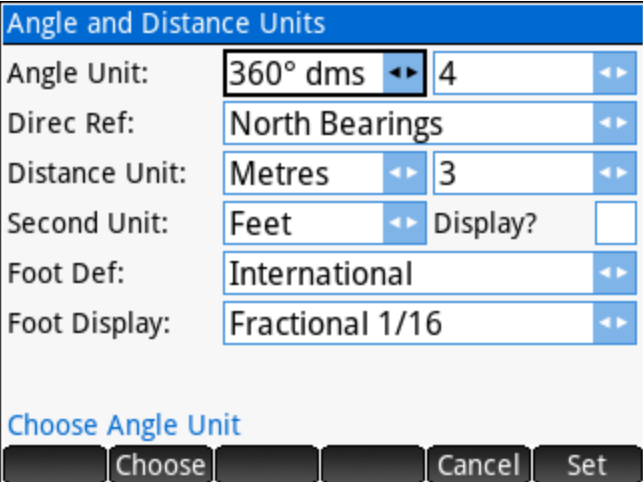

Unit settings affect input interpretation and representation.

#### Angle Unit

The angle unit may be set to **360°''' dms**, **360° dec** or **400 gon**. Angular and directional input and output will honour this setting for all functions.

#### Angle Precision

Angles and directions are displayed with the specified number of decimals.

#### Direction Reference

Direction reference may be set to **North Bearings**, **South Bearings**, or **Quadrant Bearings**.

- **North bearings** are defined by declaring north to be 0° (or 0g) while **south bearings** are defined by declaring south to be 0° (or 0g), and then measuring the full circle in a clockwise direction. Direction input and output are subject to both angle unit and direction reference settings.
- **Quadrant bearings** split the circle into NE, SE, SW, and NW quadrants, always measuring angles from north or south towards east or west. Quadrants are numbered 1-4 to facilitate fast input of quadrant bearings. For example, to enter a bearing of N36°43'15"W; the user would enter **436.4315** because the NW quadrant = quadrant 4.

## Distance Unit

The distance unit may be set to **metres** or **feet** for display and conversion purposes.

The distance unit setting DOES NOT AFFECT JOB COORDINATES. The distance unit is for input/output display only. To convert a project from metric to imperial, or vice versa, use the [Scale Points](#) option. This behaviour is consistent with how a CAD drawing operates. The coordinates are essentially unit-less, and this setting determines input and output display/calculations.

## Distance Precision

Distances are displayed with the specified number of decimals.

## Secondary Unit

The secondary unit may be set to **metres**, **feet**, **links** or **chains**. This setting determines the unit that can be used for quick conversions (to the primary unit) within distance input fields.

## Display Secondary Unit

This toggle determines if calculated distance results will be displayed in the primary unit only, or both primary and secondary units.

## Foot Definition

The foot definition setting may be set to **US Survey Foot** or **International Foot** for use with all conversions between metric and imperial.

- ▶ The definition of a **US Survey Foot** is exactly 1200/3937 metres, approximately 0.304800609601 metres.
- ▶ The definition of the **International Foot** is exactly 0.3048 metres.

## Foot Display

The foot display setting may be set to **Decimal** or **Fractional 1/16** for displaying distances in feet units.

## 3.2 Coordinates, Stations and Grades

Modify the display of coordinates, stations and grades.

### Coordinate Display

The coordinate display format may be set to display coordinates in the order of **Northing, Easting, Easting, Northing** or **X,Y**. This setting changes the order and labels for most cases where coordinates are input and/or displayed.

### Coordinate Precision

Coordinates are displayed with the specified number of decimals.

### Stationing Display

The stationing display format may be set to display stations in the format **0+00**, **0+000** or without any formatting.

### Stationing Precision

Stations are displayed with the specified number of decimals.

### Grade Display

The grade display format may be set to display grades as percentage grades **% (V/H\*100)**, ratio **V:H**, or ratio **H:V**. This setting applies to input and output of grades.

### Grade Precision

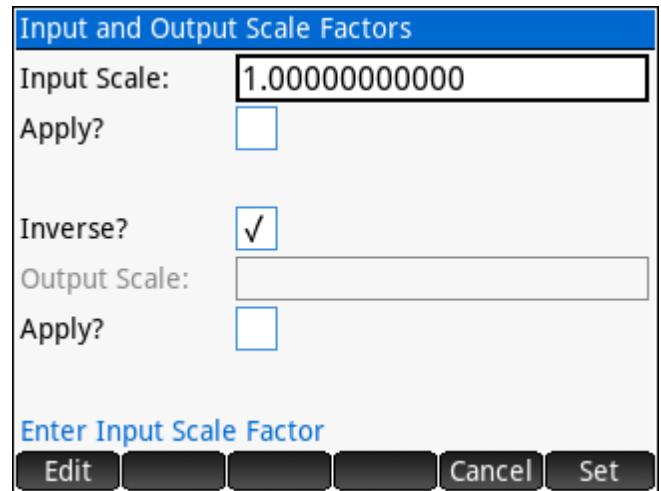

Grades are displayed with the specified number of decimals.

The screenshot shows a dialog box titled "Coordinates, Stations and Grades". It contains several settings, each with a label and a value field that has a double-headed arrow on the right side for selection or adjustment. The settings are: "Coord Display:" set to "North, East"; "Precision:" set to "3"; "Stations:" set to "0+000"; "Precision:" set to "3"; "Grades:" set to "% (V/H\*100)"; and "Precision:" set to "1". Below these settings is a link that says "Choose Coordinate Display". At the bottom of the dialog are four buttons: "Choose", "Cancel", and "Set".

Coordinates, Stations and Grades	
Coord Display:	North, East
Precision:	3
Stations:	0+000
Precision:	3
Grades:	% (V/H*100)
Precision:	1
<a href="#">Choose Coordinate Display</a>	
<input type="button" value="Choose"/>	<input type="button" value="Cancel"/> <input type="button" value="Set"/>

### 3.3 Input and Output Scale Factors

The Input Scale Factor, when enabled, is applied to all distance entries to automatically scale the distance by the specified scale factor. The Output Scale Factor, when enabled, is applied to all calculated distances to automatically scale the calculated distance. The primary use of these settings is to calculate grid coordinates by entering ground distances. The settings can also be used to work with alternate units, such as entering feet dimension in a metric project.

Input and Output Scale Factors

Input Scale: 1.000000000000

Apply? ☐

Inverse? ☒

Output Scale:

Apply? ☐

[Enter Input Scale Factor](#)

Edit Cancel Set

#### Input Scale Factor

The Input Scale Factor will be applied to any entered distance values when the toggle is set.

#### Apply Input Scale Factor

Toggle the application of the Input Scale Factor.

NOTE: When the Input Scale Factor is being applied, all distance input fields will display an asterisk after the distance value once the input has been entered and parsed, for example **30.000m \***.

#### Inverse?

Toggle the automatic calculation of the Inverse of the Input Scale Factor to set the Output Scale Factor.

#### Output Scale Factor

The Output Scale Factor will be applied to all calculated distances when the toggle is set.

#### Apply Output Scale Factor

Toggle the application of the Output Scale Factor.

NOTE: When the Output Scale Factor is being applied, all calculated distance values will be scaled by this factor, and the resulting value will be displayed with an asterisk, for example **30.000m \***.

## 3.4 Program Options

Program Options are settings that affect how the program will handle certain situations.

### Radius Tolerance

Enter a value to set the radius tolerance, used primarily by **Inverse Curve** and **Area by Points**. The distance from the BC point to the Radius point and the distance from the EC point to the Radius point cannot differ by more than this value, otherwise the points will not define a valid curve. The average of the two values  $((BC..CC+EC..CC)/2)$  is used as the radius for a curve.

Program Options

Radius Tol: 0.010000000000

Time/Date:

Auto Exit Time: 5 Minutes

Clipboard Size: 10

[Tolerance for Curve Radius difference](#)

Edit Cancel Set

### Time/Date

Toggle the display of the time and date in the header of the program.

### Auto Exit Time

Set the timeout duration for inactivity. After the specified time limit the app will start a close sequence that will see the app completely exit out. This is done to allow the calculator to go to sleep to save battery life.

### Clipboard Size

Set the maximum number of items that the clipboard will hold, must be a number in range of 1 to 100.

## 3.5 DXF File Layers

DXF File Exports are available for some routines, and the DXF File Layers settings are used when exporting the entities.

Default layer names and colours will be used until the user changes the name or colour settings.

DXF File Layers

	Layer Name	Layer Colour
Linework:	SGS_LINES	Blue
Point Node:	SGS_PTNODE	Red
Point ID:	SGS_PTID	White
Elevation:	SGS_PTELEV	Yellow
Description:	SGS_PTDESC	Cyan

[Linework Layer Name](#)

Edit Cancel Set

## 3.6 Coordinate System

Coordinate System Settings are used for [Coordinate Conversions](#) and [Ellipsoid Calculations](#).

### Projection

Various pre-defined projections are included. Coordinate systems are grouped by region and projection type. Available reference ellipsoids vary depending on the coordinate system selected. Touch the button displaying the currently set projection to change it.

### Coordinate System Groups

The available coordinate system groups are:

1. UTM Zones North
2. UTM Zones South
3. US State Planes, NAD27
4. US State Planes, NAD83
5. Other US
6. Canadian
7. European
8. Australia / New Zealand
9. South American
10. Central American
11. African
12. Middle East
13. [User Defined](#)

On the menu use the **Info** option to display the parameters of the currently set coordinate system.

Select a group to display the available coordinate systems.

Coordinate System	
Projection:	UTM Zone 11

Airy 1830
Airy 1830 (Modified)

## Radius Method

Choose the method to determine the earth radius to use for elevation factor calculations. Options include:

- **Geometric Mean** – Calculates the geometric mean earth radius for each point, using the formula:

$$r = \frac{a \times \sqrt{1 - e^2}}{1 - e^2 \times (\sin \phi)^2} \quad \text{where } a = \text{semi-major axis (radius at equator)} \quad e^2 = \text{eccentricity squared}$$

and  $\phi$  = geodetic latitude. This is the most accurate method.

- **6372000m** – Commonly used mean earth radius, may not be ideally suitable for all regions.
- **User Entered** – Some regions have adopted a mean earth radius that best fits their region.

Earth Radius

When the **Radius Method** is set to *User Entered*, enter the appropriate value for the coordinate system.

Vertical System

Choose the vertical system that will be used to arrive at ellipsoid heights for various calculations. The options are *Ellipsoidal* (requires no conversion) or *Average Geoid Height* (applies average geoid separation to obtain ellipsoid heights). Geoid file support is planned for a future release.

Average Geoid Height

The average geoid height for your project area. Ellipsoid heights (h) are calculated by adding the orthometric height (H) and the *geoid height* (N).  $h = H + N$  therefore  $N = h - H$

User Defined Coordinate Systems

When selecting *User Defined* as the **Coordinate System Group**, a list of user-created coordinate systems is displayed.

Use the **New** option on the menu to create a new coordinate system. The user can choose the projection type to create the new coordinate system. The input form that follows will prompt for the appropriate parameters required to define the coordinate system.

A final input form accepts a long and short name for the coordinate system and the Hemisphere & Orientation selections.

### 3.7 Terminology Localization

Terminology localization allows the user to control some of the terminology used throughout the program. Standard terminology differs between regions. When the calculator settings are set to English language, then this option will be available in the **SGS Prime COGO** settings. The available region selections are:

- ▶ CAN / USA (Canada / USA)
- ▶ AUS / NZL / ZAF (Australia, New Zealand, South Africa)

### 4.1 Point Traverse 2D

**Point Traverse 2D** is the main COGO application and is available in three configurations: **Standard**, **Angle Right** and **Plus**. The **Curve Traverse** option is used to calculate points from curve information.

Each of the three configurations will have a Mode option which controls automatic Point ID updating while calculating:

- ▶ **Traverse** – Traverse Mode will always advance the From Point to the new Point ID that gets stored when completing a calculation. This is ideal if calculating the perimeter of a parcel, for example.
- ▶ **Sideshot** – Sideshot Mode does not advance the From Point when a calculation is completed. This is ideal for calculating numerous points from the same base point.

## Point Traverse - Standard

**Point Traverse – Std** is a COGO application that accepts all input within a single input form.

### 'From Point' Field

This field requires an existing point number to use as the starting point, or station. Entering a point number that does not exist in the job will result in the option to create a new point.

All the Inverse Calculations as described under the [Point Traverse - Plus](#) section are also accepted.

Point Traverse – Std	
From Point:	6
Bearing:	74°25'00"
Distance:	50.000m
Offset:	0.000m
Mode:	Traverse
Perpendicular Offset (+Right, -Left)	
Edit	Cancel

### 'Bearing' Field

This field requires the direction to the new point from the **FROM POINT**. Input types accepted:

1. Bearing – The real number entered is interpreted based on the current [angle unit](#) and [direction reference](#) user settings.
2. Any of the standard [directions](#) input options.

### 'Distance' Field

This field requires the distance to the new point from the **FROM POINT**. Input types accepted:

1. A distance – The number entered is used as the distance.
2. Any of the standard [distances](#) input options.

### 'Offset' Field

This field accepts a perpendicular offset value from the line of direction. A positive offset is to the right while a negative offset is to the left. This field accepts the same types of inputs as the [Distance](#) field.

Point Traverse – Angle Right

Point Traverse – Angle Right is like [Point Traverse - Standard](#) with differences as noted below.

‘Backsight’ Field

This field requires an existing point number to use as the backsight point.

‘Angle Right’ Field

This field requires a real number angle turned right (clockwise) from the Backsight.

Point Traverse – 4 R		
From Point:	<input type="text" value="6"/>	Std
Backsight:	<input type="text" value="5"/>	
Angle Right:	<input type="text" value="74°25'00"/>	4 R
Distance:	<input type="text" value="50.000m"/>	
Offset:	<input type="text" value="0.000m"/>	Plus
Mode:	<input type="text" value="Traverse"/>	Curve
Perpendicular Offset (+Right, -Left)		
<input type="button" value="Edit"/> <input type="button" value="Cancel"/> <input type="button" value="Calc"/>		

Point Traverse – Plus

Point Traverse - Plus is a complete COGO solution with **Inverse** and **Intersection** capabilities.

‘From Point’ Screen

The **From Point** input screen prompts the user to input a point number to use as a starting point for further calculations. Input types accepted:

1. An existing point number – The program ensures the point exists.
2. A non-existing point number – The user may enter a point number that has not yet been stored in the database. An option to create the point will be presented.
3. Two point numbers in the format “From..To” – Calculate a point inverse between two points in the job. The **From Point** input screen is re-displayed after this input type is processed. For example, input **1..2** to calculate the inverse from Point 1 to Point 2.
4. Three point numbers in the format “Start..End..Offset” – Calculate a point to line inverse by entering the baseline start and end points and the offset point. The **From Point** input screen is re-displayed after this input type is processed. For example, input **1..2..3** to calculate the offset of Point 3 from the line defined by points 1 and 2.
5. Three point numbers in the format “BC+CC+EC” – Calculate a curve inverse, direction ‘right’, by entering the beginning of curve, curve center and end of curve points separated by the ‘+’ character.

Point Traverse – Plus		
From Point:	<input type="text" value="11"/>	Std
Mode:	<input type="text" value="Traverse"/>	4 R
Offsets:	<input type="text"/>	Plus
Choose Traverse or Sideshot Mode		
<input type="button" value="Choose"/> <input type="button" value="Cancel"/> <input type="button" value="OK"/>		

The **From Point** input screen is re-displayed after this input type is processed. For example, input **1+2+3** to inverse a curve connecting Point 1 and Point 3 in a clockwise direction with curve center (radius point) at Point 2.

6. Three point numbers in the format “BC-CC-EC” – Calculate a curve inverse, direction ‘left’, by entering the beginning of curve, curve center and end of curve points separated by the ‘-’ character. The **From Point** input screen is re-displayed after this input type is processed. For example, input **1-2-3** to inverse a curve connecting Point 1 and Point 3 in a counter clockwise direction with curve center (radius point) at Point 2.

## The Menu

While editing the From Point, the menu updates to show these options:

**Browse** Opens the Point Database browser where the user can select a point from the list.

## Offsets

Toggle to enable offset fields in the Direction Input screens.

## ‘Bearing 1’ Screen

This screen prompts the user to input the bearing to the new point from the **FROM POINT**. Input types accepted:

1. Bearing – The real number entered is interpreted based on the current **angle unit** and **direction reference** user settings and the next screen is displayed.
2. Any of the standard **directions** input options.
3. Leave blank, no input – Signals that the bearing to the new point is unknown, which leaves the possibility of a Distance-Bearing, or Distance-Distance intersection.

## The Menu

While editing the Direction, the menu updates to show these options:

**QB→B** **B→QB** Converts the input between quadrant bearings and full circle bearings. The appearance and action of this menu option varies depending on your **direction reference** setting.

**±180°** Reverse direction of the number in the command line by adding/subtracting 180° / 200g.

## Offset

When enabled, the offset field accepts a perpendicular offset distance from the **FROM POINT**.

## 'Distance 1' Screen

This screen prompts the user to input the distance to the new point from the **FROM POINT**. Input types accepted:

1. A distance – The number entered is used as the distance and the next screen is displayed.
2. Any of the standard **distances** input options.
3. Leave blank, no input – Signals that the distance to the new point is unknown, which leaves the possibility of a Bearing-Bearing or a Bearing-Distance intersection, provided that the **Bearing 1** input was given.

The screenshot shows a software interface titled "Point Traverse - Plus". It features a label "Distance 1:" followed by a rectangular input field. At the bottom of the screen, there is a blue text label "Distance from Point 11 (Blank if unknown)" and a row of buttons: "Edit", four empty square buttons, "Cancel", and "OK".

## The Menu

While editing the Distance, the menu updates to show these options:

**ft→m** or **m→ft** convert the input between metric and imperial units. The menu key varies depending on your **primary distance unit** setting.

## 'To Point' Screen

This screen accepts the point number of a second known point that an intersection calculation connects to.

This screen appears when either the **Bearing 1** or **Distance 1** inputs are unknown and left blank.

The screenshot shows a software interface titled "Point Traverse - Plus". It features a label "To Point:" followed by a rectangular input field. At the bottom of the screen, there is a blue text label "Intersect To Point" and a row of buttons: "Edit", four empty square buttons, "Cancel", and "OK".

‘Bearing 2’ Screen

This screen has two possible variations depending on whether **Bearing 1** or **Distance 1** is known. In both cases the screen prompts the user to enter the direction from the new point that is being calculated **TO** the second known point. This screen accepts the same input types as the **Bearing 1** screen.

Point Traverse – Plus

The Menu

While editing the Point ID, the menu updates to show these Point ID searching options:

**Low** Inserts the lowest unused point number into the command line.

**Next** Inserts the next lowest unused point number starting from the currently entered value.

Curve Traverse

The **Curve Traverse** program allows the user to enter a beginning of curve (BC) point and a radius point, enter an arc length and choose the curve direction to solve the end of curve (EC) point.

‘BC Point’ Field

Enter the beginning of curve point number. A point number is automatically suggested for this input, usually the previously stored point, which can be useful when calculating multiple points along the same arc.

‘Radial Point’ Field

Enter the radius point number. The radius point input is remembered for the next use until the user quits the **Curve Traverse** program.

‘Arc Length’ Field

Enter the arc length of the curve.

‘Direction’ Field

Choose the curve direction, ‘Right’ is clockwise, while ‘Left’ is counter clockwise.

The standard STORE POINT screen follows valid input to store the EC point.

## Bearing-Distance

A bearing-distance intersection can be solved when **BEARING1** and **DISTANCE2** are known. This type of intersection usually has two possible solutions. The user is prompted to choose which of the two solutions is desired by selecting one of the two possible **DISTANCE1** solutions. A “No Solution” error indicates that the intersection is not possible with the data provided.

SOLUTION FROM POINT 10

## 4.4 Areas / Closures

Calculate an **Area by Points**, subdivide a desired area from an existing parcel using the **Sliding Bearing** or **Hinge Point** methods, check your Plan using the **Lot Closures** routine, or use the **Quick Closure** routine to quickly check the closure of a figure or to calculate missing dimensions.

### Area by Points

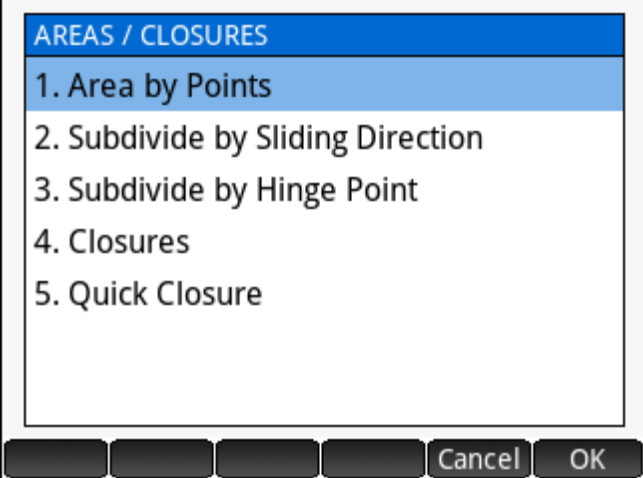

The **Area by Points** program calculates the area of a polygon when the points along the perimeter of the polygon are entered in sequence. The polygon can consist of straight segments and curves.

To enter straight segments:

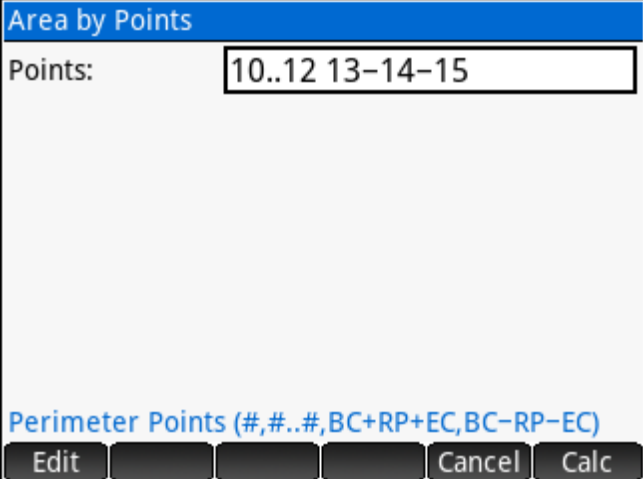

1. Enter individual points separated by spaces. For example, **1 2 3 4 5 6**.
2. Enter a range of points in sequence and in numerical ascending order. For example, **1..6**.
3. Enter any combination of the above. For example, **1 3 9..15 18 20..29 33**.

To enter curves:

1. Curve 'Right' – Enter points separated by the '+' character so that the curve is defined by BC+CC+EC. For example, **1+2+3**.
2. Curve 'Left' – Enter points separated by the '-' character so that the curve is defined by BC-CC-EC. For example, **1-2-3**.
3. Compound curves and reverse curves – Enter each curve component separately so that each curve component is its own block of points, BC+CC+EC or BC-CC-EC, and each block is separated by a space. For example, **1+2+3 3-4-5** or **1+2+3 3+4+5**, etc.

A screenshot of a software menu titled "AREAS / CLOSURES" in a blue header. The menu contains five options: "1. Area by Points", "2. Subdivide by Sliding Direction", "3. Subdivide by Hinge Point", "4. Closures", and "5. Quick Closure". The first option is highlighted in light blue. At the bottom of the menu are four small, unlabeled buttons, followed by "Cancel" and "OK" buttons.

A screenshot of the "Area by Points" dialog box. It has a blue header with the title "Area by Points". Below the header, there is a label "Points:" followed by a text input field containing the text "10..12 13-14-15". At the bottom of the dialog, there is a label "Perimeter Points (#,#..#,BC+RP+EC,BC-RP-EC)" in blue text. Below this label are five buttons: "Edit", an unlabeled button, another unlabeled button, "Cancel", and "Calc".

NOTE: An error occurs when the points provided as curve points do not actually define a curve, i.e. the radius differs by more than the [radius tolerance](#) setting.

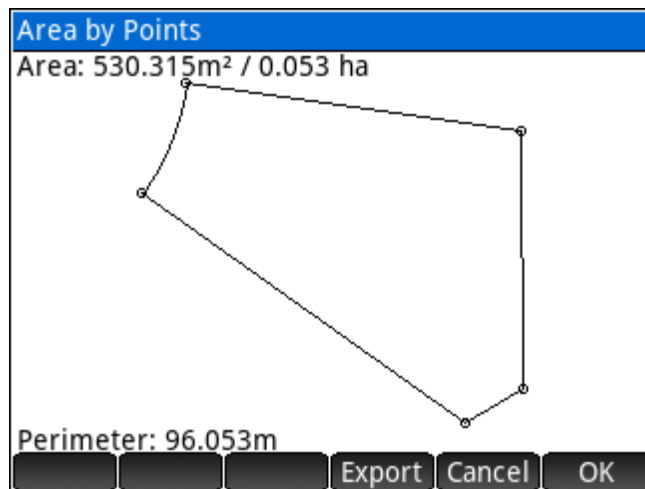

Any mix of straight segments and curves is accepted. For example, an area with straight segments and a curve could be [10 11 12 13-14-15](#) which could also be entered as [10..12 13-14-15](#).

The area (square units and hectares/acres) and perimeter are displayed following a valid input. The program automatically determines the direction (clockwise or counter clockwise) the points were entered. The [primary distance unit](#) affects the results displayed.

**Export** Export a DXF File of the area calculated

**Cancel** Exit the Area by Points program.

**OK** Return to the Input Form.

### Sample Coordinates

Point	Northing	Easting	Elevation	Description
10	3000.0000	2000.0000	0.0000	AREA
11	2979.0430	2000.1800	0.0000	AREA
12	2976.3950	1995.4290	0.0000	AREA
13	2994.9938	1969.0919	0.0000	AREA
14	3007.1076	1951.9380	0.0000	AREA_CC
15	3004.0355	1972.7121	0.0000	AREA

## Subdivide by Sliding Direction

Calculate a specified area by sliding a line of fixed bearing. For the diagram on the right, assume the known coordinates as listed and the fixed bearing line to be  $6^{\circ}10'35''$  with a desired area of  $100\text{m}^2$ . The program will calculate the coordinates for highlighted points 26 and 27 shown.

First, enter the points that define the fixed boundaries, in this example those points are 22, 23 and 24.

Next, enter the directions from the first and from the last point that you entered for the fixed points. Use any of the standard [directions](#) input options.

Next, enter the desired area and the direction of the sliding bearing.

The solution is displayed with the locations of the solution points marked as “A” and “B” on the plot.

**Export** Export a DXF File of the area subdivided.

**Cancel** Exit the Area Subdivision program.

**OK** Return to the Input Form.

A prompt provides the option to store the solution points.

Subdivide by Sliding Direction	
Fixed Points:	22 23 24
Bearing 1:	$95^{\circ}42'38''$
Bearing 2:	$84^{\circ}17'22''$
Desired Area:	100.000 Sq.m.
Bearing:	$6^{\circ}10'35''$

22	2101.000	1090.000	0.000	SLIDE
23	2096.000	1086.000	0.000	SLIDE
24	2089.000	1089.000	0.000	SLIDE
25	2090.000	1099.000	0.000	SLIDE

## Subdivide by Hinge Point

Calculate a specified area by swinging a line from a hinge point into another line of fixed bearing. For the diagram on the right, assume the known coordinates as listed and the direction from Point 35 to be parallel to the line 34-33 with a desired area of 180m<sup>2</sup>. The program will calculate the coordinates for highlighted point 36 shown.

First, enter the points that define the fixed boundaries, **starting with the hinge point**. In this example those points are **31**, 32, 33, 34 and 35.

Next, enter the direction from the last fixed point followed by the desired area. Use any of the standard [directions](#) input options.

The solution is displayed with the location of the solution point marked as “A” on the plot.

**Export** Export a DXF File of the area subdivided.

**Cancel** Exit the Area Subdivision program.

**OK** Return to the Input Form.

A prompt provides the option to store the solution point.

Subdivide by Hinge Point

4 Curve R	R 187.054m	L 62.374m
5 Line	B 221°10'51"	D 65.192m

## Delete Segment

Select a segment to delete and choose the menu option. A confirmation is required.

## Edit Segment

Select the segment to edit and choose the menu option.  
The current information is loaded for editing.

## Insert Segment

Select a segment and choose the menu option to insert a new segment before the selected segment.

## Closure Solution

When all the segments are defined, the **Calculate** option will display the results of the closure. The **Solution** page shows the numeric results, while the **Plot** page will draw the segments.

Closure SAMPLE	
Segments:	5
Precision:	1:745511
Length:	316.842m
Area:	6164.658m <sup>2</sup> 0.616 ha
Misclose Information	
Bearing:	251°58'36"
Distance:	0.000m
ΔNorthing:	0.000m
ΔEasting:	0.000m
<div>• Sol Plot Back Cancel Export</div>	

## Export Options

Export the closure results.

- ▶ **Add Closure Report to Log File** – Adds the current closure results to a **ClosureLOG.txt** file. With this option it is possible to have numerous closures reported in a single TEXT file for printing, etc.
- ▶ **Clear Log File** – Clears the ClosureLOG.txt file if it exists.
- ▶ **Export HTML Report** – Creates an HTML report of the closure. The user can enter a file name for the report, which can then be viewed in a web browser on a PC or Mac.
- ▶ **Export DXF File** – Creates a DXF file of the closure lines and curves. The user can enter a file name for the DXF file, which can then be viewed in a CAD program on a PC or Mac.
- ▶ **Store Point Coordinates** – Store the points that define the closure. Coordinates are calculated from the starting point coordinates for the closure. The user can enter a Starting Point ID and a descriptor for the points.

Quick Closure

A **Quick Closure** is created by entering the known dimensions of the sides of a figure. There are no points or coordinates required and the results are not stored; it is optimized for quick entry and ease of use.

A closure may have one or two missing dimensions, which will be calculated whenever possible.

Curved segments may also be entered by specifying a chord distance and curve radius.

Examples will be used to illustrate the methods and results obtained.

Example 1 – Closure with all dimensions known

The **Quick Closure** routine immediately opens to an input screen, prompting for the direction of the first line.

The entered values of the previous input are displayed for verification.

The menus provide the standard tools for working with direction and distance inputs.

Enter each direction and distance as prompted, then **Calc** after entering the fifth and final distance.

Quick Closure

Continue data entry until complete.  
Press ENTER for any unknown component.

Use [Calc] to finish.

## 4.5 Fit Points

The **Fit Points** program consists of:

1. Best fit points to **Straight Line**, linear regression.
2. Best fit points to **Circular Curve**, like linear regression but fits points to a circular curve.
3. Solve the position of a lost corner using the **Double Proportionate Method**.
4. Solve the position of a lost corner using the **Irregular Boundary Adjustment Method**.
5. Solve the positions of lost angle points using the **Grant Boundary Adjustment Method**.

### Fit to Straight Line

Enter a series of points to compute the least squares straight line that best fits the points. Enter point numbers using any of the [point numbers](#) input options.

An un-weighted linear regression method that minimizes X and Y residuals simultaneously is used to calculate the line.

The direction and Y-Intercept of the line, the correlation coefficient (a value between -1 and 1), and the point offsets standard deviation are computed and displayed.

## The Menu

- Sol** Displays the solution details.
- Offs** Displays the perpendicular offsets to the line for each point used in the computation.
- Direc** Option to enter a direction constraint for the line or use the best fit direction. The solution details page indicates whether a **Best Direction** or **Fixed Direction** is in effect.
- Use -** **Use +** While viewing the perpendicular offsets, toggle whether the selected point will be used for the calculation.

Best Fit Line		
Point	Offset from Line	Use
70	0.010m	Yes
71	0.012m	Yes
72	-0.040m	Yes
73	0.002m	Yes
74	0.015m	Yes
75	0.001m	Yes

**Sol** **• Offs** **Direc** **Use -** **Cancel** **Adjust**

Proceeding with the adjustment provides the option to overwrite the existing points or to create new points.

Points are shifted perpendicular to the best-fit line to minimize the shift.

```

Fit to Circular Curve

The main purpose of this program is to calculate the radius and the coordinates of the radius point of the least squares circle that best fits a series of points. When providing points along one or both tangents, the program will also solve the BC and/or EC point coordinates.

In the input form, enter a series of points along the curve to compute the circle that best fits the points. Enter point numbers using any of the [point numbers](#) input options.

**Optional:** Also enter points on the Tangent In/Out to compute the BC/EC points. If specifying tangent points, it is important to select the correct curve direction Right/Left.

The curve solution displays the computed radius, the radius standard deviation, the coordinates of the radius point, and if applicable, the bearings of the back and forward tangents.

## Double Proportion

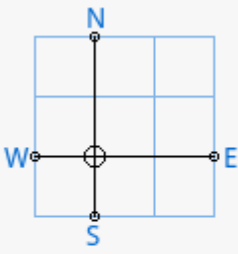

“The term ‘double proportionate measurement’ is applied to a new measurement made between four known corners, two each on intersecting meridional and latitudinal lines, for the purpose of relating the cardinal equivalent intersection to both.” (Page 166, BLM Manual of Surveying Instructions 2009).

The **Double Proportion** program solves this type of problem by accepting point numbers for the four known corners, and the record measurements to the lost corner.

The first input form requires existing point numbers of the corners to the north, east, south and west of the lost corner.

**Double Proportion**

Point N:	<input type="text" value="80"/>
Point E:	<input type="text" value="81"/>
Point S:	<input type="text" value="82"/>
Point W:	<input type="text" value="83"/>

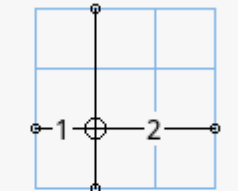

Enter Point to the North

Edit    Cancel OK

The second input form requires the **record** bearings and distances to the known corners west and east of the lost corner.

**Double Proportion**

Bearing 1:	<input type="text" value="N89°52'00\"/>
Distance 1:	<input type="text" value="2638.68'"/>
Bearing 2:	<input type="text" value="N89°37'00\"/>
Distance 2:	<input type="text" value="2640.00'"/>

Enter Record Direction 1

Edit    Cancel OK

The third input form requires the **record** bearings and distances to the known corners north and south of the lost corner.

Double Proportion

Irregular Boundary Adjustment

Irregular boundaries are the result of boundaries surveyed from opposite directions, or piecemeal surveys where resulting boundaries are not straight lines. “In order to restore one or more lost corners or angle points on such irregular exterior, a retracement between the nearest known corners is made on the record courses and distances to ascertain the direction and length of the closing distance. A position is calculated for each lost corner or angle point at the record position.” (Page 174, BLM Manual of Surveying Instructions 2009) A combination of single proportion and compass rule is then used to re-establish the lost corner. The direction (East-West or North-South) determines how the adjustment is performed.

The **Irregular Boundary** program prompts for the direction of the line, and then the first input form requires the point numbers for the surveyed points (W + E, or N + S).

## Grant Boundary Adjustment

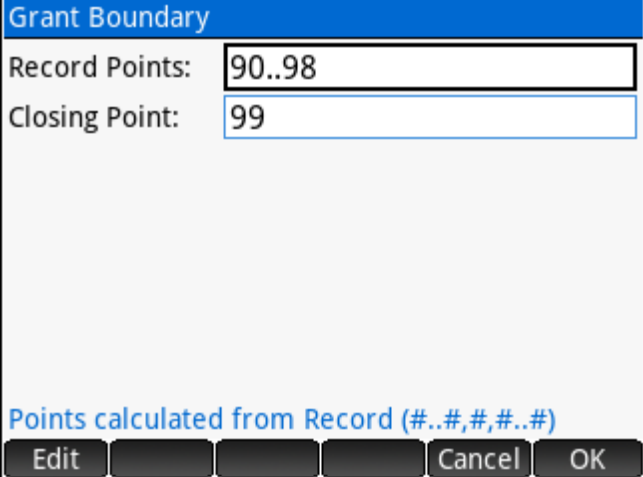

*“In many of the States there are irregular grant and reservation boundaries that were established prior to the public rectangular surveys. In these cases, the township and section lines are regarded as the closing lines. The grant boundary field notes may call for natural objects, but these are often supplemented by metes-and-bounds descriptions. The natural calls are ordinarily given precedence then the existent angle points of the metes-and-bounds survey. The lost angle points are then restored by uniformly orienting the record courses to the left or right and adjusting the lengths of the lines on a constant ration.” (Page 176, BLM Manual of Surveying Instructions 2009)*

The **Grant Boundary** program requires a series of points that define the grant boundary, starting with a known (found) point followed by calculated points using **record** dimensions. The first field asks for these points. The second field asks for a **Closing Point**, which is a found original point representing the last calculated point that was entered. The spatial difference between the closing point and the last calculated point determines the adjustment parameters.

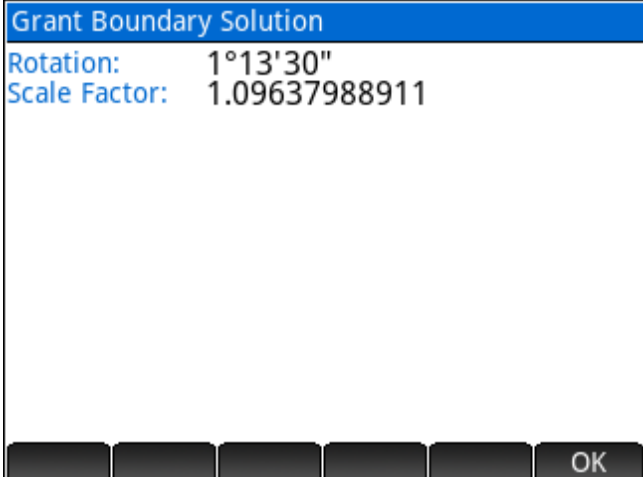

The calculated rotation and scale are displayed on the results screen.

A choice is presented to adjust the record points.

Proceeding with the adjustment provides the option to overwrite the existing points or to create new points.

The 'Grant Boundary' dialog box has a blue title bar. It contains two input fields: 'Record Points:' with the value '90..98' and 'Closing Point:' with the value '99'. Below the fields is a blue text label 'Points calculated from Record (#..#,#, #..#)'. At the bottom are four buttons: 'Edit', a disabled button, a disabled button, and 'Cancel'. An 'OK' button is located at the bottom right.

The 'Grant Boundary Solution' dialog box has a blue title bar. It displays two lines of text: 'Rotation: 1°13'30"' and 'Scale Factor: 1.09637988911'. At the bottom are five disabled buttons followed by an 'OK' button.

### 5.1 Compass Rule

A “compass rule” or “bowditch rule” adjustment distributes the linear misclose of a traverse proportionally throughout each leg of a traverse. A ‘closed figure’ traverse ends back on the starting point while a ‘close to fixed point’ traverse ends on a known control point that is held fixed.

#### Closed Figure

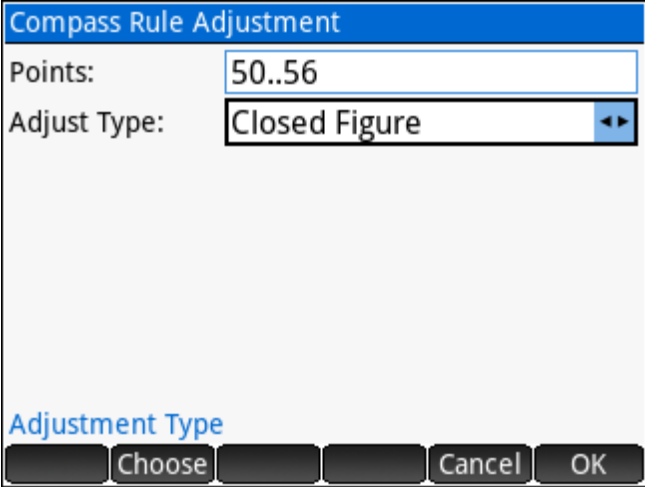

A known starting point, followed by a series of intermediate points, and ending back on the starting point defines a closed figure. Prior to adjustment, the loop ending point coordinates as measured will differ from the starting point coordinates. The difference between these coordinates will be distributed proportionally through each leg of the figure.

First, enter the point numbers using any of the [point numbers](#) input options, and select the Adjustment Type.

Next, an option to **Balance Angles** is presented. If the closing angle is known, choose “Yes”, otherwise choose “No”.

If the user selected “Yes” to balance angles, an input form will allow for the closing angle to be entered.

## 5.2 Rotate/Mirror Points

**Rotate Points** around a base point or the coordinate system origin, and **Mirror Points** mirrors points along a baseline.

### Rotate around Base Point

First, enter the point number to use as a base point.

Next, select if you're entering a known rotation angle, or if you are calculating the rotation angle from two reference directions.

- ▶ Enter a positive angle for clockwise rotation and a negative angle for a counter clockwise rotation.
- ▶ Use any of the standard [directions](#) input options to enter reference directions.

Next, enter the points to rotate, and select how to store the newly calculated points.

ROTATE AND MIRROR POINTS

## 5.4 Scale Points

Scale Points from a Base Point or from the coordinate system origin (0,0).

### Scale from Base Point

Point coordinates can be scaled from a base point with separate scale factors for the horizontal and vertical components.

First, enter the point number to use as the **Base Point**.

Next, specify the horizontal and vertical scale factors.

Options exist on how to define the scale factors:

- ▶ **User Entered** – Enter a scale factor value. It is possible to enter a math operation such as  $1/0.99962051$  to calculate the scale factors.
- ▶ **Feet to Meters** – The scale factor is automatically determined.
- ▶ **Meters to Feet** – The scale factor is automatically determined.
- ▶ **Input Scale Factor** – From User Settings.
- ▶ **Output Scale Factor** – From User Settings.

SCALE POINTS

1. Scale from Base Point

Last, enter the points to scale, and select how to store the newly calculated points.

### Scale from Origin (0,0,0)

Like **Scale from Base Point**, except no base point is required, the points will be scaled from 0,0,0.

## 5.5 Transform Coordinates

Transform point coordinates in one coordinate system to another by matching up control points using the **Helmert Transformation** tool or create 2D cross section points from points on a 3D feature such as a building face using the **3D to Plan Cross Section** utility.

### Helmert Transformation

The **Helmert Transformation** program is a least squares coordinate transformation program that allows the user to transform points from one coordinate system to another. A two-dimensional conformal coordinate transformation (aka four-parameter similarity transformation) is used to calculate the least squares transformation. Scale, rotation and translation are computed when a minimum of two common control points are present in two separate coordinate systems. The procedure in general is:

1. Match up control points from both coordinate systems, i.e. these points represent the same objects in two different coordinate systems.
2. Calculate the transformation and review the residuals for each control pair that was defined.
3. If necessary, modify the control points used to address any “poorly fitting” control pairs.
4. Apply the transformation to a specified range of points.

The main **Helmert Transformation** screen accepts all input through the menu:

- Add** Add control pairs to be used for the calculation.
- Delete** Delete the selected control pair from the calculation.
- Edit** Edit the selected control pair.
- Param** Set the Scale **Parameter**, which can be fixed at 1 or calculated best fit. The title in the header indicates (No Scale) when the scale parameter is fixed, or (Scaled) when the calculated scale factor will be applied.

Once at least two pairs are added, their horizontal distance residuals are displayed.

Add Control Pairs

The **Local Point** is in the coordinate system that you wish to transform, while the **Fixed Point** is in the coordinate system that is not changing. Points can be matched in 1D, 2D, 3D or None. You may continue entering all your control pairs without leaving the DEFINE CONTROL PAIRS input form.

Define Control Pair

Local Point:202

Fixed Point:1202

Match Type:3D

Choose how to Match Points

ChooseCancelOK

Delete or Edit Control Pairs

Control pairs can be deleted or edited when necessary. From the main **Helmert Transformation** screen, select a control pair and use menu options to delete or edit the selected control points. The screen updates immediately to reflect the changes made.

Helmert Transformation (No Scale)

Local	Fixed	Match	Hz Dist
201	1201	3D	0.001m

AddDeleteEditParamCancelCont

Calculate Solution

Use **Cont** to display the calculated transformation parameters based on the defined control pairs.

The solution presented displays the best-fit transformation parameters (scale, rotation, and translation in northing and easting) as well as the standard deviation in the northing and easting and the calculated average elevation shift between any/all control pairs that were matched 3D. The menu:

- Sol** Display the transformation solution.
- ΔXYZ** Display the coordinate residuals for each control pair.
- ΔPol** Display the polar distance and direction residuals for each control pair.
- Back** Return to the previous input screen to Add/Delete/Edit control pairs.

### 3D to Plan Cross Section

In the diagram on the right, consider the red dots shown as being reflector-less measurements made with a total station. The goal is to calculate the ratio of glass surface area to total surface area of the wall. The 3D to Plan program transforms the 3D measured coordinates into 2D plan points to create a section view.

First, define the section cut line by entering a point towards the left of the section cut line, and a point to the right of the section cut line. Consider the points measured at the base of the walls as the section cut line, Point 101 on the left and Point 102 on the right. Elevations of the calculated points can be calculated from their offsets relative to the baseline, or the elevations can be set to zero, if not important.

Next, enter the points to transform, and select how to store the newly calculated points.

## 6.2 Horizontal Curves

Three options to solve horizontal curves:

1. [Circular Curve Solver](#) – Solve a simple circular curve by entering two known elements.
2. [Curve Through Fixed Point](#) – Calculate the curve that passes through a fixed point. Calculations are possible when a point on the back tangent, at the PI, on the forward tangent, and the fixed point are provided.
3. [Spiral Curve Solver](#) – Solves all the Spiral-Curve-Spiral parameters when entering a Spiral Length, a total SCS deflection angle, and the curve radius.

### Circular Curve Solver

The circular curve solver requires two known curve elements and solves for the rest. Acceptable input combinations include:

- ▶ The radius and any of the other accepted inputs.
- ▶ The deflection angle and any of the other accepted inputs.
- ▶ The arc length and the chord length. **NOTE: THIS TYPE OF SOLUTION INVOKES THE ITERATIVE NEWTON'S METHOD TO SOLVE FOR THE REMAINING VALUES. THE RESULT ACCURACY DEPENDS ON THE INPUT PRECISION.**

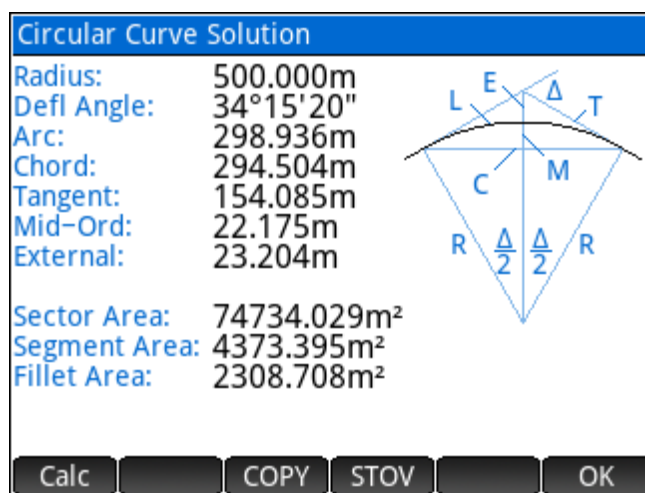

### Degree of Curve

A **Deg of Curve** button provides easy access to determine the radius of the curve by degree of curve, both chord and arc definitions are available.

The solution displays all the elements of the circular curve, including the sector, segment and fillet areas.

The **Calc** button on the menu features Tangent Offset calculations.

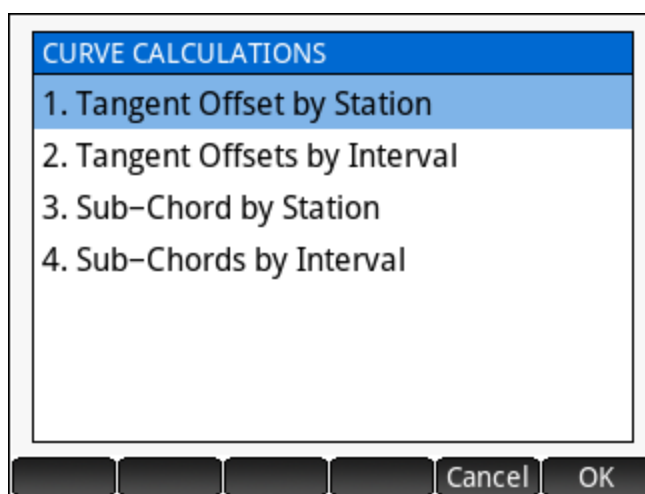

## Curve Calculations

Further calculations are possible with the solved curve parameters.

- ▶ **Tangent Offset by Station** – Enter any station on the curve to calculate the tangent distance and offset to layout the curve using the Tangent Offset method.
- ▶ **Tangent Offsets by Interval** – Calculates the tangent distances and offsets for all stations on the curve at a specified interval.
- ▶ **Sub-Chord by Station** – Enter any station on the curve to calculate the turned angle and chord distance from either end of curve to layout the curve using the Sub-Chord method.
- ▶ **Sub-Chords by Interval** – Calculates the turned angles and chord distances for all stations on the curve at the specified interval.

For all methods, enter the known station at either the BC, PI or EC to continue with the calculations.

**Tangent Offset by Station**

Known Station: **BC**

Station: **0+000.000**

## Curve Through Fixed Point

The Curve through Fixed Point solver solves a curve that is required to fit fixed tangents and a fixed point. In the diagram to the right, let's assume that the back tangent from Point 1 to Point 2 is a street curb line, and the forward tangent from Point 2 to Point 3 is also a street curb line. A curve is required so that the curb will pass through Point 4, which represents the back of a catch basin, for example.

In the input form; enter the points on the BT (Back Tangent), at the PI (Point of Intersection), on the FT (Forward Tangent), and OC (On the Curve).

The diagram is for general reference only.

### Sample Coordinates

Point	Northing	Easting
1	4684.500	3249.912
2	4683.400	3299.900
3	4635.620	3314.635
4	4674.714	3299.210

p	Distance from Tangent that the Curve (Ghost BC) has been Offset	Lc	Length of Curve (not labelled)
Tc	Tangent of Curve (not labelled)		

## 6.3 Vertical Curves

The Vertical Curve Solver solves vertical curves using various combinations of known parameters, including:

1. Grades and Length known – Requires a known station at the BVC, VPI or EVC, the vertical curve length, entry and exit grades, and a known elevation at the BVC VPI, EVC or the High/Low point on the curve.
2. Elevations and Length known – Requires a known station at the BVC, VPI or EVC, the vertical curve length, and elevations at the BVC, VPI and EVC.
3. Fixed Point, VPI and Grades known – Requires the station and elevation at the VPI, a fixed-point station and elevation, entry and exit grades.
4. Fixed Point, BVC and Grades known – Requires the station and elevation at the BVC, a fixed-point station and elevation, entry and exit grades.
5. Intersect Slopes from two known points – Requires the vertical curve length, the entry grade, a station with a known elevation on the entry tangent, the exit grade, and a station with a known elevation on the exit tangent.

Solution Screen and Calculations

For each of the combinations of known parameters to solve a vertical curve; the solution screen displays the unknown solved parameters, and the menu on the solution screen is the same for all combinations, offering the same functionalities:

**Int** Calculate elevations at all stations at a given interval.

**Elev?** Calculate elevations on the vertical curve by entering a station.

**Sta?** Calculate stations on the vertical curve by entering an elevation.

Vertical Curve Solution

BVC Station:

0+000.000

BVC Elev:

## 6.4 RPN Calculator

The RPN Calculator is designed for survey calculations with units for distance, angle, area and volume.

### Main Interface

Use the **touch screen** to:

- ▶ Select an object on the stack
- ▶ Open the Edit Line
- ▶ Toggle the current menu
- ▶ Execute a menu option

The **Keyboard** keys have common functions assigned:

- ▶ to DUP Level 1 of the stack
- ▶ or to SWAP Level 1 and 2 of the stack. Moves the cursor when the Edit Line is open.
- ▶ to DROP Level 1 of the stack. + clears the stack.
- ▶ to exit the application, cancel the Edit Line, or unselect a stack object.
- ▶ or to scroll through the stack. + or jumps to the top or bottom level of the stack. When no object is selected on the stack, opens the Edit Line.
- ▶ and to UNDO the previous action. Only one level of UNDO is possible.
- ▶ / / + to toggle the **Vars** / **Tools** / **Units** menus.
- ▶ + to store a variable, more details in the **Vars** menu section.

## Stack Area

The Stack Area displays six levels of the stack. Stack objects can be selected by using the touch screen or the ▲ and ▼ keys. The stack will scroll up and down as required.

When a stack object is selected, the menu will always change to the following options:

- EDIT** Edit the selected value. When editing is complete, the value remains selected.
- STRIP** Strip any associated unit from the object.
- COPY** Copy the object to the Clipboard.
- ECHO** Echoes the selected object to the Edit Line. When editing is complete, the previous stack selection is no longer selected.
- PICK** Pick the selected object and copy it to Level 1 of the stack. The object remains selected on the stack.
- ROLL** Roll the selected object down to Level 1 of the stack. The stack level of the selection is not changed.

RPN Calculator	
6:	Vars
5:	Tools
4: 1.6478	Units
3: 14°59'13"	Stack
2: 252.400ft²	Exit
1: 14.000m	
<div>EDIT STRIP COPY ECHO PICK ROLL</div>	

## Edit Line

The Edit Line displays the value being entered or edited and is also used to display any status or error messages. When the Edit Line is open; the menu updates with the primary angle and distance units to assign to the entered value, and **Cancel** and **OK**. Copy and Paste are available with **Shift** and **View Copy**, and **Shift** and **Menu Paste**.

NOTE: It is possible to enter feet, inches, fractions in the [specified comma-delimited format](#). The current distance unit will automatically be applied to the value entered. The unit conversion happens automatically if required.

## Menu Toggles

Four different menus are available within the app for specific tasks; the menu toggles change the current menu or group of menus.

## Menus

### Vars Menu

The **Vars** Menu displays all the variables stored on the HP Prime as **HVars**. The first and last menu keys are used to change the page of the menu while the middle four keys show the names of the variables.

- ▶ Tap any of the keys to pop the variable's content onto Level 1 of the stack.
- ▶ Press **Shift** and then tap any of the keys to store the value on Level 1 of the stack into the variable.
- ▶ Enable **ALPHA** mode and then **0** followed by the menu key to quote a variable name. Use the **PURGE** option from the Tools menu to purge the quoted variable.
- ▶ Press **Shift** + **EEX** to store a variable. If Level 1 is a string then it will be used as the variable name to store object on Level 2, otherwise prompts for a variable name to store Level 1.
- ▶ Type the variable name (without quotes) followed by **Enter** to recall the variable contents.
- ▶ When storing or recalling a variable, any associated units are kept intact (with the exception of the Links distance unit).

### Tools Menu

- EDIT** Edit Level 1 of the stack.
- STRIP** Strip any associated unit from the object on Level 1 of the stack.
- STO** Stores the object on Level 2 of the stack into the variable name on Level 1 of the stack. When Level 1 is not a string, then a touchscreen keypad opens to enter a variable name.
- PURGE** Purges the variable name on Level 1 of the stack from memory. When Level 1 is not a string, then a list of variables is shown, and the variable can be chosen to be purged.
- P<>R** Toggles between rectangular and polar display modes of vectors.

Requires a vector on Level 1 of the stack.

- >V>** Compiles a vector from stack objects or explodes a vector if Level 1 contains a vector.

To build a vector; Level 1 of the stack needs to be a 2 or 3 to specify the dimension (2D or 3D) and levels above must contain either the rectangular or polar components of the vector.

Exploding a vector results in vector components on the stack and a 2 or 3 on Level 1 of the stack indicating if it was a 2D or 3D vector.

## Units Menu

Four pages of the **Units** menu exist. The first and last menu keys on each page are used to change the page of the menu. The four menus are

► Angle Units	◀	DMS	D.d°	Gon	Rad	▶
► Distance Units	◀	m	ft	lks	ch	▶
► Area Units	◀	m²	ft²	ha	Ac	▶
► Volume Units	◀	m³	ft³	yd³		▶

Units can be assigned to any value as it is typed, is on Level 1 of the stack or is selected on the stack.

Unit conversions are single tap if the existing value is unit-less or is of the same type of unit.

## Stack Menu

<b>DUP</b>	DUPLICATE Level 1 of the stack. {... 3 2 1} to {... 3 2 1 1}
<b>SWAP</b>	SWAP Level 1 and Level 2 of the stack. {... 3 2 1} to {... 3 1 2}
<b>DROP</b>	DROP Level 1 of the stack. {... 3 2 1} to {... 3 2}
<b>OVER</b>	COPY OVER Level 2 and place it on Level 1 of the stack. {... 3 2 1} to {... 3 2 1 2}
<b>ROT</b>	ROTate the bottom three levels of the stack. {... 3 2 1} to {... 2 1 3}
<b>UNROT</b>	UNROTate the bottom three levels of the stack. {... 3 2 1} to {... 1 3 2}

## Vector objects

2D and 3D vectors are supported.

- Use **Shift** + to open the vector entry form where a rectangular or polar vector can be entered.
- Use **Shift** + to convert the vector on Level 1 of the stack between polar and rectangular display modes.
- Vectors can be added or subtracted, and multiplied or divided by a scalar.

## 6.5 Configure Settings

See the [User Settings](#) chapter.

## 7 Points Menu

- ▶ [Store and Edit Points](#) – Store new points in the current project database or edit the coordinates and description of an existing point.
- ▶ [Delete Points](#) – Delete points from the current project database.
- ▶ [Rename Points](#) – Rename a range of points using a New Starting Number scheme or an Additive Number scheme.
- ▶ [Plot Points](#) – Graphically display the points in the current project. Zoom and pan functionality is available with all points in the current project, or a specified range of points.
- ▶ [Import / Export](#) – **Import ASCII Points**, **Export ASCII Points** and **Export DXF Points**.

### 7.1 Store and Edit Points

It is possible to store and edit points in the same input form.

#### Point ID

Enter a Point ID to edit its coordinates or to store a new point. The coordinate and description fields automatically populate with existing coordinates and description if the point exists.

Options while editing this field:

- Low** Search for the lowest unused point number in the job.
- Next** Search for the lowest unused point number starting from the current value.

Store and Edit Points	
Point ID:	<input type="text" value="1"/>
Northing:	<input type="text" value="0.000m"/>
Easting:	<input type="text" value="0.000m"/>
Elevation:	<input type="text" value="0.000m"/>
Description:	<input type="text" value="COGO"/>
<div>Point Identifier</div> <div> <input type="button" value="Edit"/> <input type="button" value="Low"/> <input type="button" value="Next"/> <input type="button" value="Cancel"/> <input type="button" value="Store"/> </div>	

## 7.2 Delete Points

Delete individual points, a range of points or all the points from the current job. To delete individual points or ranges of points, enter points using any of the [point numbers](#) input options.

Check the **All Points** checkbox to delete all points.

Delete Points

Point(s):

All Points: ☐

Enter Point(s) to Delete (#..#,#,#..#)

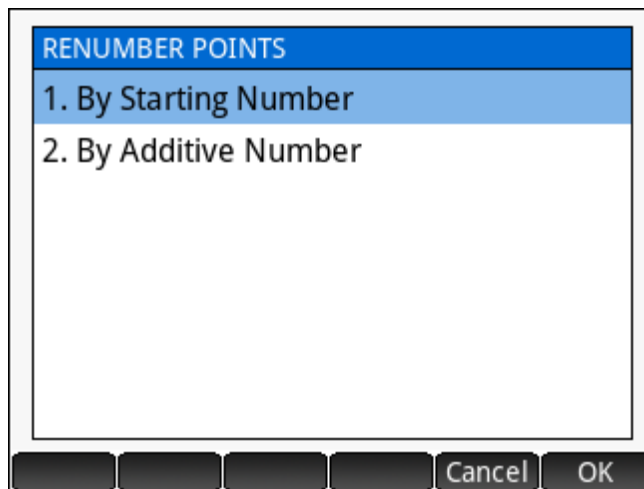

Edit

Cancel

Delete

## 7.3 Renumber Points

Two methods are available for point renumbering.  
Neither method overwrites conflicting point numbers.

The screenshot shows a dialog box titled "RENUMBER POINTS". It contains two options: "1. By Starting Number" and "2. By Additive Number". The first option is highlighted with a blue background. At the bottom of the dialog, there are four empty buttons followed by "Cancel" and "OK" buttons.

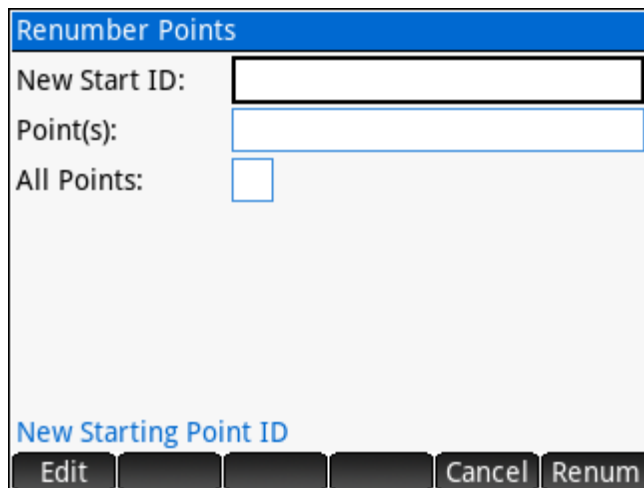

### By Starting Number

Enter the New Starting Point ID to use for renumbering.  
The points' new numbers will begin at this starting number, or in the case where the provided starting number exists, the next available number.

Enter the points to be renumbered using any of the [point numbers](#) input options or check the **All Points** checkbox to renumber all the points in the current project.

Some examples to illustrate this method of renumbering points:

1. When a new starting point number is given as 101, and existing points 1 to 4 are to be renumbered, Point 1 becomes 101, 2 becomes 102, etc.
2. Same as above but in fact there already exists a Point 101, then Point 1 becomes 102, 2 becomes 103, etc.
3. Same as above but there is no Point 3, then 1 becomes 101, 2 becomes 102, and 4 becomes 103.

The screenshot shows a dialog box titled "Renumber Points". It has three input fields: "New Start ID:" with a text box, "Point(s):" with a text box, and "All Points:" with a checkbox. Below these fields is a label "New Starting Point ID" in blue. At the bottom, there are four buttons: "Edit", an empty button, another empty button, and "Cancel", followed by a "Renum" button.

## By Additive Number

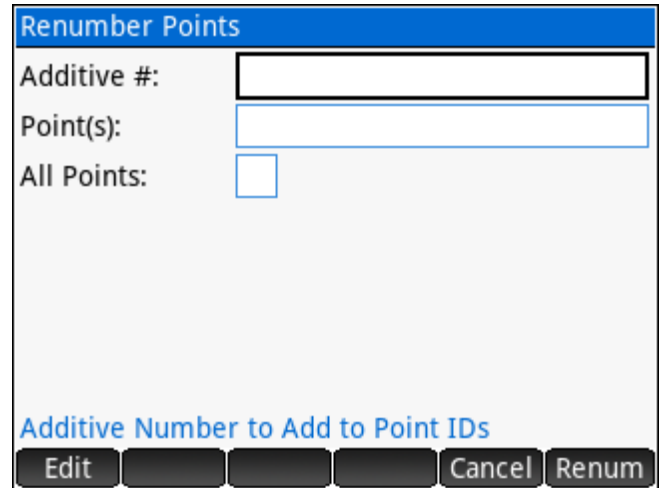

Enter an additive number to add to existing point numbers as a renumbering method. In the case where this added number creates a point number that already exists, the next available number will be used.

Enter the points to be renumbered using any of the [point numbers](#) input options or check the **All Points** checkbox to renumber all the points in the current project.

Some examples to illustrate this method of renumbering points:

1. When an additive number is given as 100, and existing points 1 to 4 are to be renumbered, Point 1 becomes 101, 2 becomes 102, etc.
2. Same as above but in fact there already exists a Point 101, then Point 1 is NOT renumbered, 2 becomes 102, etc.
3. Same as above but there is no Point 3, then 1 becomes 101, 2 becomes 102, and 4 becomes 104.

Always ensure that the range of numbers you wish to use are not already in use.

Point(s):

All Points: ☐

[Additive Number to Add to Point IDs](#)

Edit

## 7.4 Plot Points

Plot Points by default will display all points in the current project. The initial map view is zoomed to fit all the points on the screen. Point range filters can be applied to limit the points that are displayed.

Keyboard and touch navigation are possible.

### Using Touch

- ▶ Drag to Pan
- ▶ Pinch to Zoom
- ▶ Tap to Center on the tap location

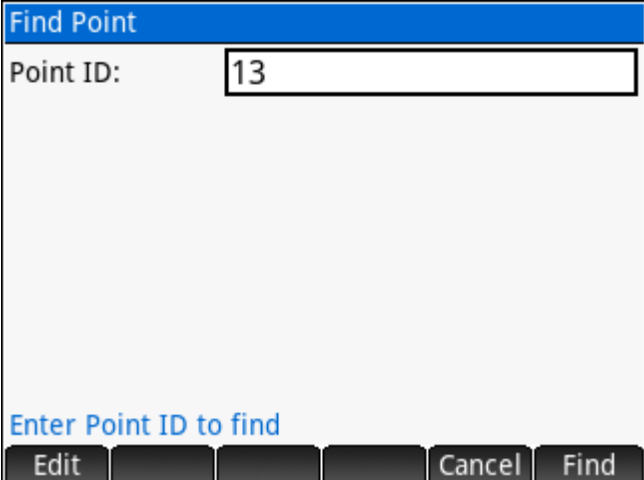

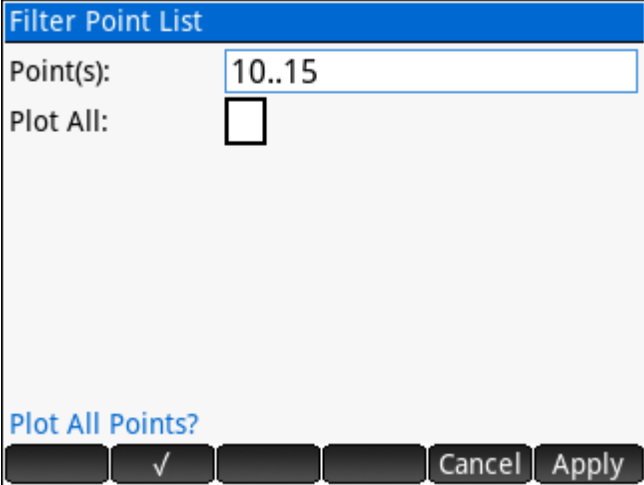

### Using the Keyboard

- ▶ Cursor keys to pan / and /
- ▶  and  to Zoom

### Using the Menu

- Filter** Set a point range filter
- Find** Find a specific point and center on it
- Extent** Zoom Extents
- PtID** Toggle to display the Point ID
- Desc** Toggle to display the Point Description
- Close** Close the Plot Points screen

Access Plot Points from any input form or the main menu by using the  key on the keyboard.

## 7.5 Import/Export

Import and Export files containing Point data from/to the App Files on the Prime calculator.

### Import Points

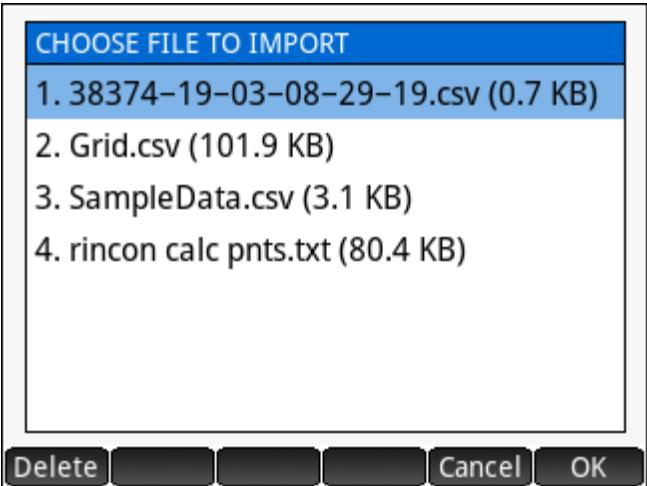

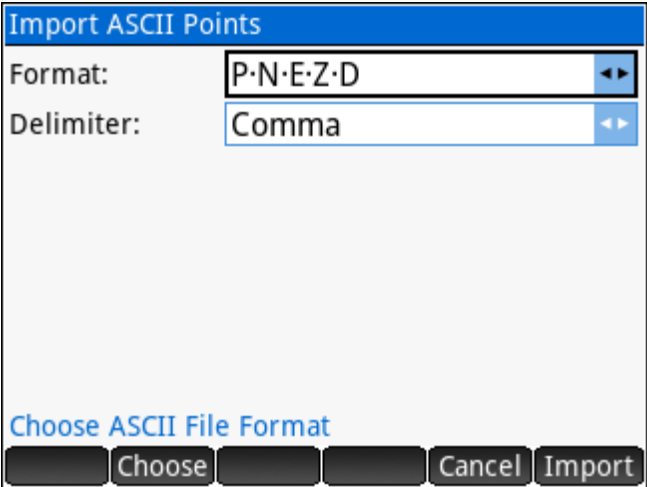

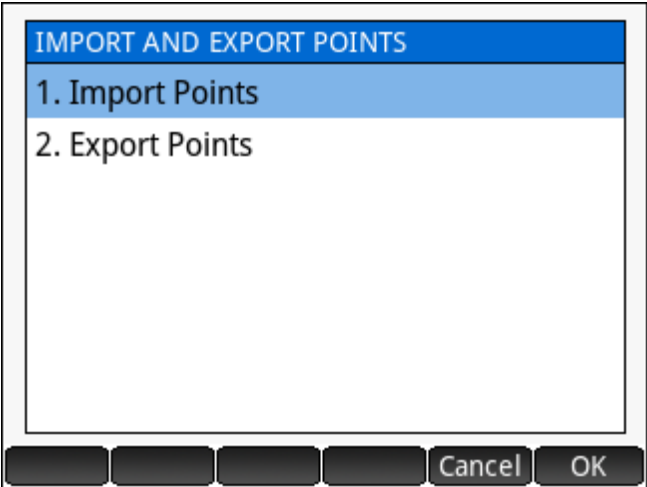

Import a delimited ASCII points file into the current project database. The file must be present within the App Files section of the **SGS Prime COGO** app and must have one of the following extensions:

- ✓ .asc     **A**SCII text file
- ✓ .csv     **C**omma **S**eparated **V**alues
- ✓ .txt     **T**e**X**T file
- ✓ .pts     **S**TAR\***N**ET point coordinates
- ✓ .gnd     **S**TAR\***N**ET ground coordinates

First, select the format and delimiter of the ASCII file you wish to import. **NOTE: THIS STEP IS CRITICAL TO ENSURE THAT THE DATA IS STORED CORRECTLY.**

Select an ASCII file from the list to import.

The selected file is parsed line by line and the coordinates are stored if valid data is found. Point number conflicts result in a screen showing the coordinate differences and **YES/NO/YES TO ALL/NO TO ALL** options to overwrite the existing point(s). The import progress is displayed while the file is processed, and the total number of points added or modified in the project database is reported when import is completed.

During Import, lines starting with the # character are ignored.

Export Points

Points can be exported in ASCII, DXF or KML format. Each of the three options are available as a page within the main input form.

Export ASCII Points

Write a delimited ASCII points file of points in the current project for archiving or importing into CAD software on your PC, or any number of other possible uses.

Select the ASCII file format, the delimiter and the number of decimals to export.

Enter a file name to save the exported points and choose the file extension. By default; the file name will be populated with the current project name, and the file extension will be set to the previously used extension.

Enter the points you wish to export using any of the [point numbers](#) input options, or optionally select **All Points** to export all points.

The export progress is displayed while the program is working, and the total number of points exported is displayed when complete.

When a file name conflict is encountered, the option to overwrite the existing file is given.

NOTE: The available number of decimals for selection ranges from 0 to 8, however the calculator is capable of a maximum of 12 digits for real numbers. The actual number of decimals may not be possible when point coordinates are stored in higher numerical ranges.

Export ASCII Points

Format: P·N·E·Z·D

Delimiter: Comma

Decimals: 4

File Name: Default.csv

Point(s):

All Points:

Choose ASCII File Format

Choose

Cancel

Export

ASCII

DXF

KML

## Export DXF Points

Write a DXF file (ASCII format) of points in the current project to open with CAD software on your PC.

Select the items to export. Point nodes are always exported, but the text attributes of the points are optional.

Specify the text height for the text attributes. By default, for metric projects the text height will be suggested as 1.0, and for imperial projects the text height will be suggested as 3.0.

Point IDs:	<input checked="" type="checkbox"/>	ASCII
Descriptions:	<input checked="" type="checkbox"/>	
Elevations:	<input checked="" type="checkbox"/>	
Text Height:	1.0	DXF
File Name:	Default.dxf	KML
Point(s):		
All Points:	<input type="checkbox"/>	
<a href="#">Export Point ID Text?</a>		
		Cancel Export

Enter a file name to save the exported points. By default; the file name will be populated with the current project name.

Enter the points you wish to export using any of the [point numbers](#) input options, or optionally select **All Points** to export all points.

The export progress is displayed while the program is working, and the total number of points exported is displayed when complete.

When a file name conflict is encountered, the option to overwrite the existing file is given.

The point node and text entities will be created using the [DXF File Layers](#) settings.

## Export KML Points

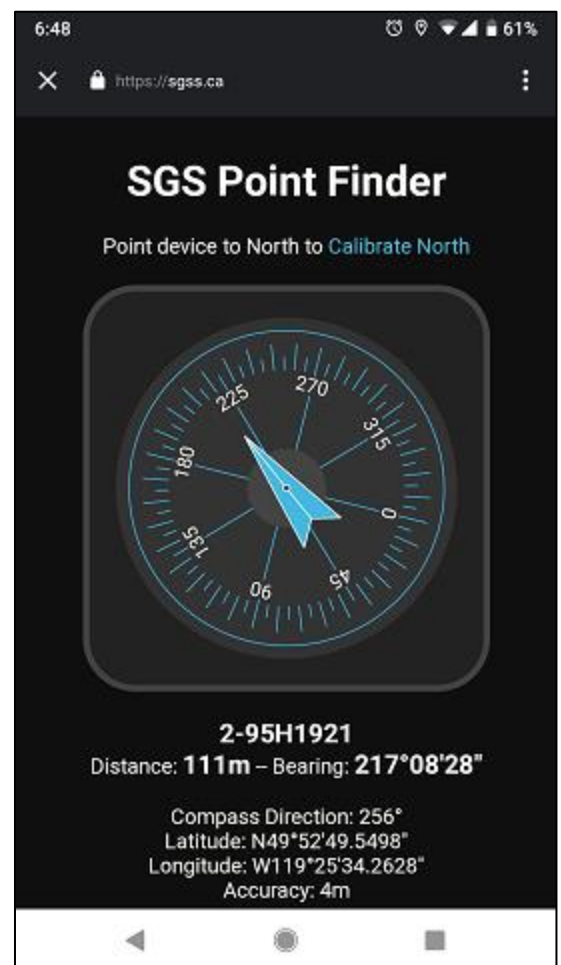

Write a KML file of points in the database so that they can be viewed in Google Earth (or other GIS related software).

Select the icon colour for the icons that the points will be displayed with in Google Earth.

Ensure the correct coordinate system is set, and if necessary, set a transformation to transform the exported points. Available options for transformations include [Ground to Grid](#) and [3 or 7 Parameter](#) transformations.

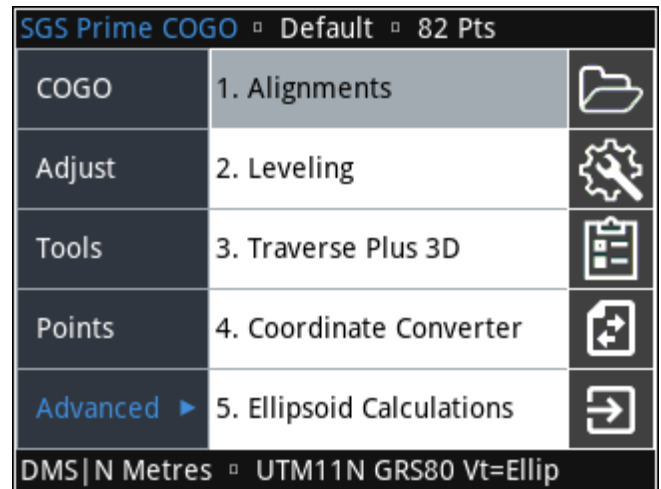

Export KML Points	
Icon Colour:	<input type="text" value="Red"/>
File Name:	<input type="text" value="Default"/> .kml
Point(s):	<input type="text"/>
All Points:	<input type="checkbox"/>
Coord Sys:	<input type="text" value="UTM Zone 11"/>
Transform:	<input type="text" value="No Transformation"/>
<a href="#">Choose point icon colour</a>	
<input type="button" value="Choose"/>	<input type="button" value="Cancel"/> <input type="button" value="Export"/>

HINT: Open the KML in Google Earth on your mobile device to take advantage of the “Find” feature which will use the mobile device geo-location to guide you to the point.

## 8 Advanced Menu

- ▶ [Alignments](#) – Create complex 3D alignments and perform various calculations.
- ▶ [Leveling](#) – Enter and edit level observations, export and perform calculations.
- ▶ [Traverse Plus 3D](#) – Calculate coordinates from field notes, simulate data collection and field calculation procedures.
- ▶ [Coordinate Converter](#) – Convert coordinates between grid, geodetic and cartesian. Convert from one grid projection to another grid projection using 3 or 7 parameter transformations. Convert between grid and ground based on provided parameters.
- ▶ [Ellipsoid Calculations](#) – Calculate DIRECT and INVERSE Computations on the ellipsoid.

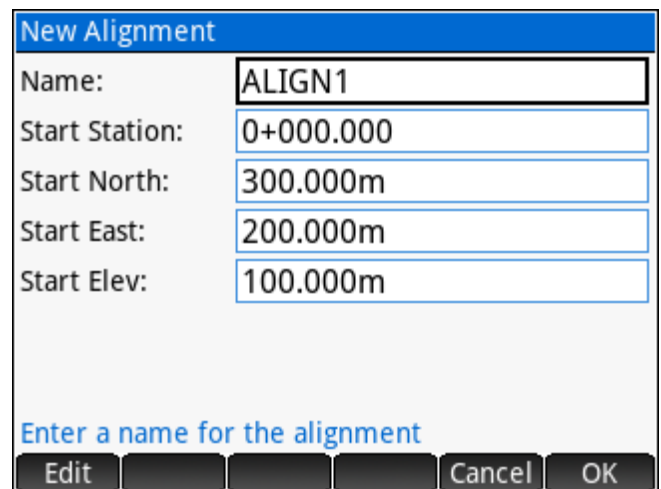

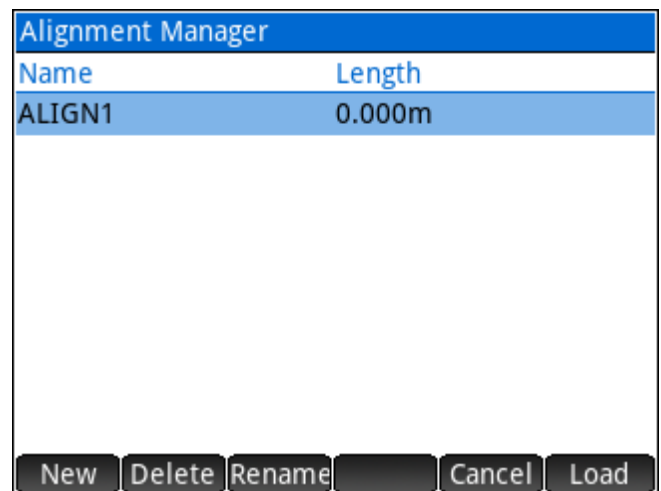

### 8.1 Alignments

**SGS Prime COGO** includes an Alignments program to manage multiple complex 3D alignments. Each alignment consists of horizontal, vertical and cross section components. The horizontal centerline of the alignment is the only mandatory definition for any alignment. Various calculations are possible with alignments.

#### Alignment Manager

The Alignment Manager lists all the alignments created, and allows the user to create new alignments, delete existing alignments, or to load an alignment for editing, review and calculations. Available Options:

- New** Create a new Alignment.
- Delete** Delete the selected alignment
- Rename** Rename the selected alignment.
- Load** Load the selected alignment.

Defining an Alignment

The interface features 5 tabs on the right edge of the screen; each tab allowing the user to edit different components of the alignment. Within each tab, the defined segments are displayed, and the menu provides access to all the functionality. The menu is common across the tabs.

- Edit** Edit the selected segment.
- Delete** Delete the selected segment.
- Info** Display more information about the selected segment.
- Calc** Perform Calculations with alignment data.
- Add** Add a new element to the current active component.

Horizontal Alignment

A new alignment is created by default to have a starting station of 0 (displayed as 0 or 0+00 or 0+000 depending on the user setting) and starting coordinates of 0,0. These parameters can be edited at any time; the entire horizontal alignment is updated to reflect any starting point station and coordinates changes.

Edit Horizontal Alignment			
Segment	Station	Length	Horiz
1 Start	0+000.000	--	Horiz Vert Xsec Eqs Xtemp
2 End	0+000.000	--	
<b>Edit</b> <b>Delete</b> <b>Info</b> <b>Calc</b> <b>Cancel</b> <b>Add</b>			

Add Horizontal Segment

With the Horizontal Alignment tab active, use the **Add** button or **Enter** to add a new horizontal segment. All segments are added to the end of the list of already defined segments. The end coordinates of the existing alignment are used as the starting coordinates for the new segment. The available options for horizontal segments are:

- Straight
- Curve, and
- Spiral-Curve-Spiral.

ADD HORIZONTAL SEGMENT	
1. Straight	
2. Curve	
3. Spiral-Curve-Spiral	
<b>Cancel</b> <b>OK</b>	

### *Horizontal Straight*

Horizontal Straight segments may be defined using one of three methods:

1. Direction and Length
2. Direction and End Station, or
3. End Coordinates

STRAIGHT METHOD

1. Direction and Length
2. Direction and End Station
3. End Coordinates

Four empty input fields, Cancel, OK

### *Horizontal Curve*

Horizontal Curve segments may be defined using one of eight methods:

1. Radius and Length
2. Radius and Delta
3. Radius and PI Station
4. Radius and EC Station
5. Radius and PI Coordinates
6. Radius and EC Coordinates
7. CC and PI Coordinates
8. CC and EC Coordinates

CURVE METHOD

1. Radius and Length
2. Radius and Delta
3. Radius and PI Station
4. Radius and EC Station
5. Radius and PI Coordinates
6. Radius and EC Coordinates
7. CC and PI Coordinates

Four empty input fields, Cancel, OK

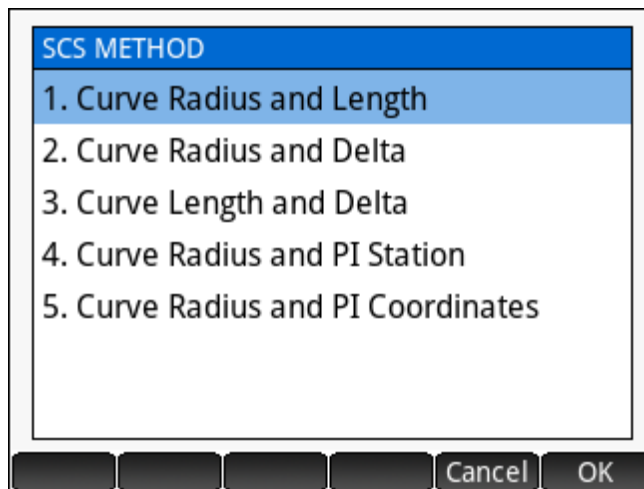

NOTES: Methods 1-4 also require the “Tangent In” direction, which is automatically calculated from the previous element. Methods 1-6 also require the curve direction, left or right. For all radius fields, a “Degree of Curve” option is available to calculate the radius from the Degree of Curve, arc or chord definition.

### *Horizontal Spiral-Curve-Spiral*

Horizontal Spiral-Curve-Spiral segments may be defined using one of five methods:

1. Curve Radius and Length
2. Curve Radius and Delta
3. Curve Length and Delta
4. Curve Radius and PI Station
5. Curve Radius and PI Coordinates

A screenshot of a software dialog box titled "SCS METHOD" in a blue header bar. The dialog contains a list of five options: "1. Curve Radius and Length", "2. Curve Radius and Delta", "3. Curve Length and Delta", "4. Curve Radius and PI Station", and "5. Curve Radius and PI Coordinates". The first option is highlighted with a blue background. At the bottom of the dialog, there are four small, dark, square buttons followed by "Cancel" and "OK" buttons in a light gray bar.

SCS METHOD

1. Curve Radius and Length
2. Curve Radius and Delta
3. Curve Length and Delta
4. Curve Radius and PI Station
5. Curve Radius and PI Coordinates

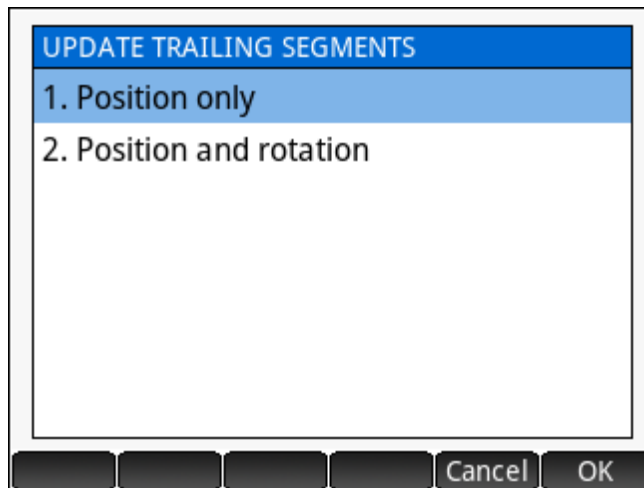

Cancel OK

NOTES: The curve radius refers to the radius of the circular curve portion. PI station and coordinates refer to the PI of the transition curve, not the circular portion. All methods require the “Tangent In” direction, which is automatically calculated from the previous element. All methods require the curve direction, left or right. For all radius fields, a “Degree of Curve” option is available to calculate the radius from the Degree of Curve, arc or chord definition.

### Edit Horizontal Segment

Touch **Edit** to edit the selected horizontal segment. For each segment type, straight, curve or SCS, the same options are available as when adding a new segment. The current values are automatically inserted into the input form regardless of which method is chosen.

When edits are made to a segment, the segment itself is updated, and any segments following the edited segments are also updated. A prompt allows the user to choose whether to update the position only, or the position and rotation of any trailing segments.

A screenshot of a software dialog box titled "UPDATE TRAILING SEGMENTS" in a blue header bar. The dialog contains a list of two options: "1. Position only" and "2. Position and rotation". The first option is highlighted with a blue background. At the bottom of the dialog, there are four small, dark, square buttons followed by "Cancel" and "OK" buttons in a light gray bar.

UPDATE TRAILING SEGMENTS

1. Position only
2. Position and rotation

Cancel OK

### Delete Horizontal Segment

Touch **Delete** to delete the selected horizontal segment. When a segment is deleted, all segments following the deleted segment are shifted to join the segment preceding the deleted segment. Where applicable; the option to update position or position and rotation is presented.

Vertical Alignment

Generally, the vertical alignment is defined after the horizontal alignment and the extents of the vertical alignment match the horizontal alignment, however a vertical alignment may start and end within or outside the parameters of the horizontal alignment. By default, the vertical alignment is defined to start at Station 0 and Elevation 0. These parameters may be edited at any time.

Edit Vertical Alignment			
Segment	Station	Length	
1	Start	0+000.000	--
2	End	0+000.000	--

Add

Add Vertical Segment

With the Vertical Alignment tab active, use the 

Add

 button or 

Enter

 to add a new vertical segment. All segments are added to the end of the list of already defined segments. The end elevation of the existing vertical alignment is used as the starting elevation for the new segment. The available options for vertical segments are:

- Straight, or
- Curve (Parabola)

ADD VERTICAL SEGMENT

1. Straight

2. Curve (Parabola)

Cancel

OK

Vertical Straight

Vertical Straight segments may be defined using one of four methods:

1. Length and Grade
2. End Station and Grade
3. Length and End Elevation
4. End Station and End Elevation

NOTES: For each method, the length or end station field is automatically set to match the end of the horizontal alignment. Grade values are automatically determined from the preceding segment.

STRAIGHT METHOD

1. Length and Grade

2. End Station and Grade

3. Length and End Elevation

4. End Station and End Elevation

Cancel

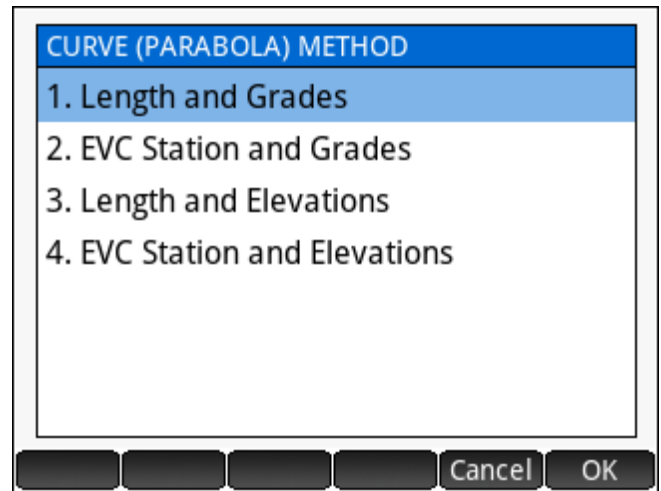

OK

### *Vertical Curve (Parabola)*

Vertical Curve segments may be defined using one of four methods:

1. Length and Grades
2. EVC Station and Grades
3. Length and Elevations
4. EVC Station and Elevations

NOTES: For each method, the length or end station field is automatically set to match the end of the horizontal alignment. Entry grade values are automatically determined from the preceding segment.

CURVE (PARABOLA) METHOD

1. Length and Grades
2. EVC Station and Grades
3. Length and Elevations
4. EVC Station and Elevations

Four empty input fields, Cancel, OK

#### Edit Vertical Segment

Touch **Edit** to edit the selected vertical segment. For each segment type, the same options are available as when adding a new segment. The current values are automatically inserted into the input form regardless of which method is chosen.

When edits are made to a segment, the segment itself is updated, and any segments following the edited segments are also updated by moving its start/end stations to keep a continuous vertical alignment without overlaps or gaps.

#### Delete Vertical Segment

Touch **Delete** to delete the selected vertical segment. When a segment is deleted, all segments following the deleted segment are shifted to join the segment preceding the deleted segment.

Cross Section Assignments

Cross section assignments require a cross section template, which can be created from the bottom-most tab labeled “Xtemp”. Cross section assignments are dependent on the vertical alignment. When a vertical alignment is not defined for a station, the cross-section assignment will be ignored for the station when performing any calculations.

Edit Cross Section Assignments		
Start Station	End Station	Template
0+000.000	0+414.220	XSTEMP1

Add

Add Cross Section Assignment

With the Cross-Section Assignment tab active, use the 

Add

 button or 

Enter

 to add a new assignment.

To add a new assignment; specify the start and end station for the assignment and choose a pre-defined template to assign to the range of stations.

Assignments are chained together, therefore a second or subsequent assignment will only allow the end station to be edited.

Add Cross Section Assignment

Start Station: 0+000.000

End Station: 0+414.220

Template: XSTEMP1

Enter the Starting Station

Edit

Cancel

OK

Edit Cross Section Assignment

Touch 

Edit

 to edit the selected assignment. The current values are automatically inserted into the input form.

When edits are made to an assignment, the assignment itself is updated, and any assignments following the edited assignment are also updated by moving its start/end stations to keep a continuous chain without overlaps or gaps.

Delete Cross Section Assignment

Touch 

Delete

 to delete the selected assignment. When an assignment is deleted, all assignments following the deleted assignment are shifted to join the assignment preceding the deleted assignment.

## Station Equations

Station equations are used to change the stationing at key points, often where the alignment meets another alignment. A station equation consists of a Station Back and Station Ahead. The Station Back is the chainage of the alignment up to that point, and the Station Ahead is the chainage that is adopted moving ahead.

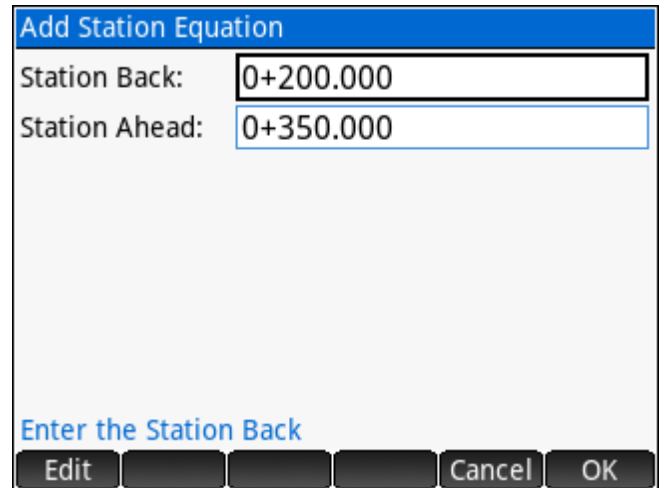

NOTE: Station Equations should be defined first if other components of the alignment will be defined with the modified stationing.

### Add Station Equation

With the Station Equation tab active, use the **Add** button or **Enter** to add a new equation.

To add a new equation, specify the station back and station ahead.

Equations should be entered in sequence if multiple equations exist. It is up to the user to ensure the order and definition is correct. Once created, station equations will impact stationing input and output.

### Edit Station Equation

Touch **Edit** to edit the selected equation. The current values are automatically inserted into the input form.

Only the selected equation is impacted, there is no relationship between separate equations.

### Delete Cross Section Assignment

Touch **Delete** to delete the selected equation. No changes will occur to any remaining equations.

Cross Section Templates

Cross section templates are used to define cross sections of alignments and can be re-used unlimited times once created. The cross-section template manager lists all the templates created. New templates can be created, and existing templates can be deleted or edited. The menu provides access to the operations described below.

Edit Cross Section Templates		
Template	Segments	
XSTEMP1	0	Horiz
		Vert
		Xsec
		Eqs
		Xtemp
Edit	Delete	Info
Calc	Cancel	Add

Add Cross Section Template

With the Cross-Section Template tab active, use the **Add** button or **Enter** to add a new template. A name is required to create a new template.

Edit Cross Section Template

Touch **Edit** to edit the selected cross section template. The Template Editor opens to edit the template.

Delete Cross Section Template

Touch **Delete** to delete the selected template. It is not possible to delete a template currently assigned to an alignment.

### *Delete Offset Segment*

Touch **Delete** to delete the selected offset segment. Only the left-most or right-most segments may be deleted.

### *Plot Template*

Touch **Plot** to plot the template cross section.

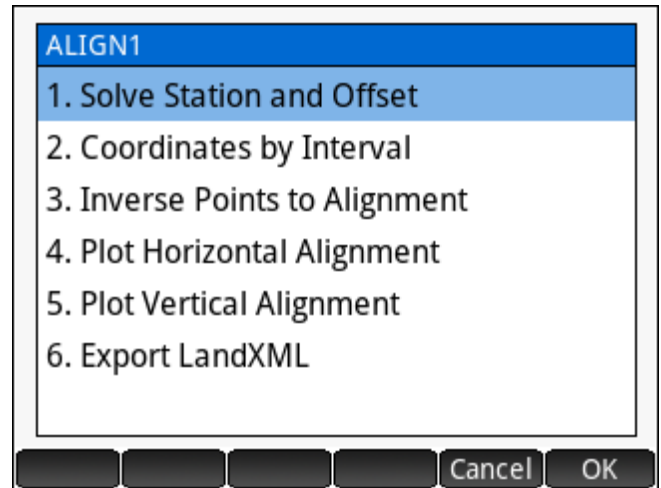

## Alignment Calculations

When an alignment has been defined, the alignment definition can be used for:

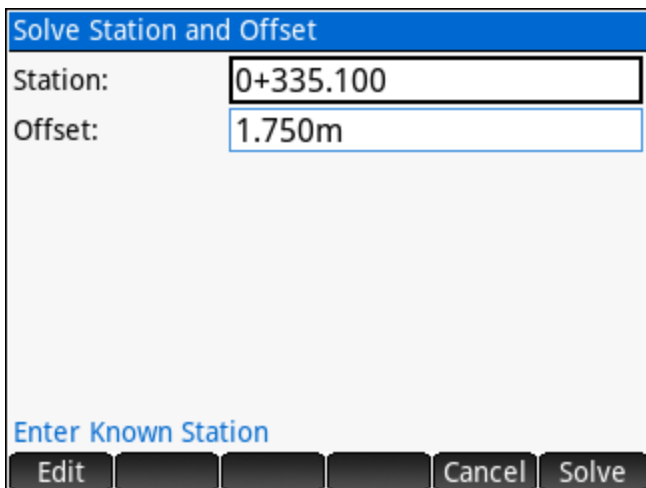

- ▶ Solve Station and Offset – By entering any station and offset along the alignment, the 3D coordinates of the point are solved.
- ▶ Coordinates by Interval – Specify a station interval to calculate 3D points at each interval along the alignment.
- ▶ Inverse Points to Alignment – Calculate the station, offset and cut/fill of any point in the current project relative to the alignment.
- ▶ Plot Horizontal Alignment – Draws the horizontal alignment on the screen.
- ▶ Plot Vertical Alignment – Draws the vertical alignment on the screen.
- ▶ Export LandXML – Writes a LandXML file of the alignment.

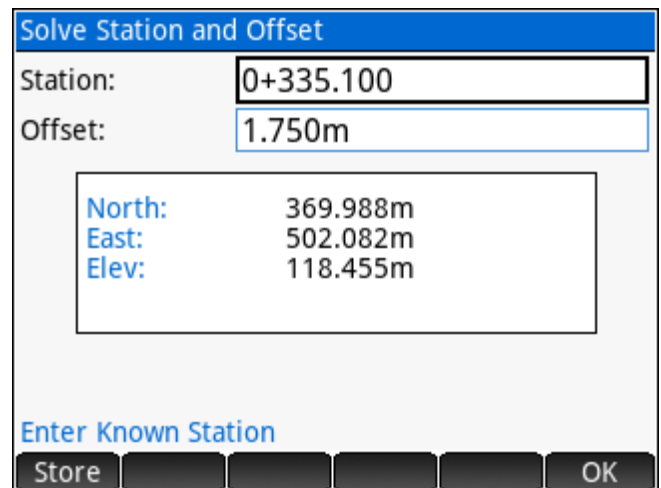

A screenshot of a software menu titled "ALIGN1". The menu contains six numbered options: 1. Solve Station and Offset, 2. Coordinates by Interval, 3. Inverse Points to Alignment, 4. Plot Horizontal Alignment, 5. Plot Vertical Alignment, and 6. Export LandXML. The first option is highlighted. At the bottom of the menu are four small, unlabeled buttons, followed by "Cancel" and "OK" buttons.

### Solve Station and Offset

Simply enter the station and offset to solve the coordinates.

A screenshot of the "Solve Station and Offset" dialog box. It has a blue header bar with the title. Below the header, there are two input fields: "Station:" with the value "0+335.100" and "Offset:" with the value "1.750m". At the bottom left, there is a link that says "Enter Known Station". At the bottom right, there are four small, unlabeled buttons, followed by "Cancel" and "Solve" buttons.

A screenshot of the "Solve Station and Offset" dialog box showing the output. The "Station:" and "Offset:" fields are the same as in the previous screenshot. Below these fields, there is a box containing the calculated coordinates: "North: 369.988m", "East: 502.082m", and "Elev: 118.455m". At the bottom left, there is a link that says "Enter Known Station". At the bottom right, there are four small, unlabeled buttons, followed by "Store" and "OK" buttons.

Use the **Store** option to store the coordinates as a point in the current project.

## Coordinates by Interval

To calculate and store points automatically, specify the parameters:

- ▶ Station Interval – Points will be created at each interval, including at each break point of any cross-section assignment at the station.
- ▶ Transition Points – Toggle specifies whether to store points at the station of the horizontal transition points where segments start/end.
- ▶ Radius Points – Toggle specifies whether to store radius points of any curves within the station range.
- ▶ Start ID – The Point ID to use for the first point calculated, then incremented for each subsequent calculation. Existing points will never be overwritten, the next available ID will be used when a conflict is encountered.
- ▶ Start Station – The Starting Station to begin calculations.
- ▶ End Station – The Ending Station to end calculations.

Coordinates by Interval

Transition Pts:	<input checked="" type="checkbox"/>
Radius Points:	<input checked="" type="checkbox"/>
Start ID:	1
Start Station:	0+000.000
End Station:	0+414.220
Include Transition Points?	
<input type="checkbox"/>	<input checked="" type="checkbox"/>
<input type="button" value="Cancel"/> <input type="button" value="OK"/>	

## Inverse Points to Alignment

Enter a single point or a range of points to inverse to the alignment. A maximum horizontal offset may be specified to ensure the point offset information is applied to the correct segment. A vertical offset constant may be entered to report cuts/fills to an offset from the vertical design. The vertical method may be set to template or centerline.

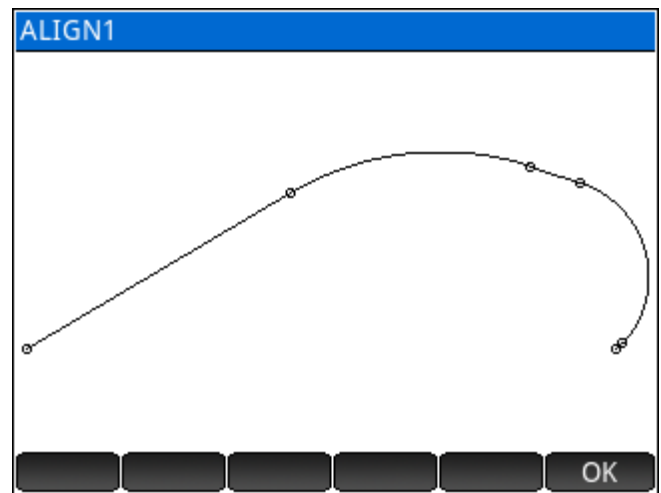

**Export** Results may be exported in [CSV](#) or [HTML](#) format.

Inverse Points to Alignment

### Plot Horizontal Alignment

Draws the horizontal alignment on the screen.

### Plot Vertical Alignment

Draws the vertical alignment on the screen.

### Export LandXML

Specify a name for the XML file to export the alignment definition in LandXML format.

Many software packages can read the LandXML files, see <http://landxml.org/> for more information on the LandXML schema.

8.2 Leveling

**SGS Prime COGO** includes a Leveling program to manage multiple leveling projects. Each project consists of backsight, foresight and intermediate foresight observations. Edit and review observations and perform calculations such as cuts/fills using observed data.

Leveling Project Manager

The Project Manager lists all the Leveling projects created, and allows the user to create new projects, delete existing projects, or to load a project for edits and calculations. Available Options:

- New

Create a new Project. Enter a name for the project to create a new project and specify the project-specific settings. The project is added to the Project Manager List.
- Delete

Delete the selected project. A confirmation prompt is displayed.
- Edit

Edit the project name and settings.
- Load

Load the selected project.

Projects can be created with option to use default distances or to require entered distances to observed stations. Turn Point prefixes can be customized for the job.

## Working with a Leveling Project

New projects contain no observations or data, therefore some of the options are not available until enough data has been entered.

The interface displays the observation data entered and the menu provides access to all the functionality.

<b>Edit</b>	Edit the selected observation.
<b>Delete</b>	Delete the selected observation.
<b>Data</b>	Review or process the Observation Data.
<b>Calc</b>	Perform Calculations from project data.
<b>BS</b> or <b>FS</b>	Enter a backsight or foresight observation.

LEVEL1 Observations			
Reading	Station	Rod	Hz Dist
No Observations ...			

## Entering the Initial Backsight

The first observation of any Leveling project is the initial backsight observation. The elevation of the initial backsight is required; however, it can be edited later if needed.

Level Start	
Station:	23-011
Elevation:	233.904m
Backsight:	2.023m
Distance:	50.000m
Description:	CWBM 23-011

Starting Station

Edit Cancel OK

LEVEL1 Observations			
Reading	Station	Rod	H <sub>z</sub> Dist
1 BS	23-011	2.023m	50.000m

## Entering Foresights

When entering foresights, toggles are available to specify the station as an Intermediate Foresight (IFS) or a Turn Point. Leaving both toggles unchecked specifies a Network Foresight Station.

### Intermediate Foresights

A Station name is still required; however, the BS / FS action of the menu will remain as FS. All intermediate foresights are entered before the observation to the Network Foresight Station.

### Turn Points

Turn Points are automatically given a "TPx" name, where x starts at 1 and increments at each Turn Point. Turn Points are generally temporary locations for the sake of carrying on a Level Run. Turn Point stations are not selectable for Cut/Fill calculations, etc.

Observe Foresight	
Foresight:	1.597m
Distance:	50.000m
Intermediate:	<input checked="" type="checkbox"/>
Station:	
Turn Point:	<input type="checkbox"/>

## Entering Backsights

The Station name is not editable when entering a Backsight observation.

Observe Backsight	
Backsight:	1.446m
Distance:	50.000m
Station:	TP1
Approximate Hz Distance to Backsight	
<input type="button" value="Edit"/>	<input type="button" value="Cancel"/>
<input type="button" value="OK"/>	

LEVEL1 Observations				
Reading	Station	Rod	Hz	Dist
1	BS	23-011	2.023m	50.000m
2	FS	TP1	1.597m	50.000m
3	BS	TP1	1.446m	50.000m
Edit Delete Data Calc Cancel FS				

## Deleting Observations

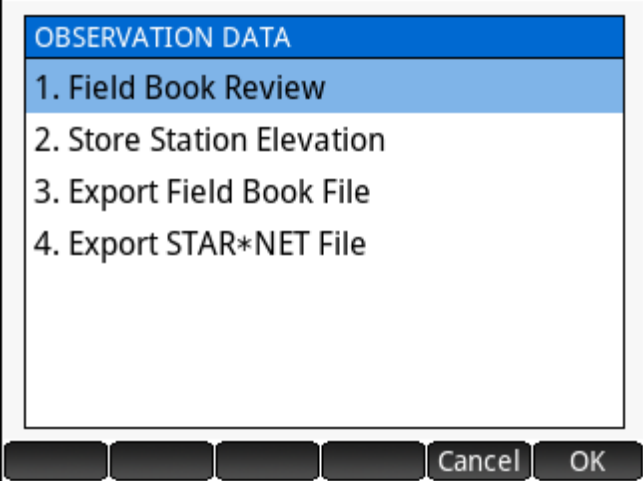

The selected observation may be deleted, if it is either:

1. An Intermediate Foresight observation, or
2. The very last observation entered

A confirmation prompt is displayed prior to deletion. An error message is displayed when the observation cannot be deleted.

## Observation Data

Review the observation data in a typical field book format, store a Level Station elevation to a point in the current project point database, export a text file of the current field book observations, or export a STAR\*NET format data file for a Least Squares adjustment using STAR\*NET.

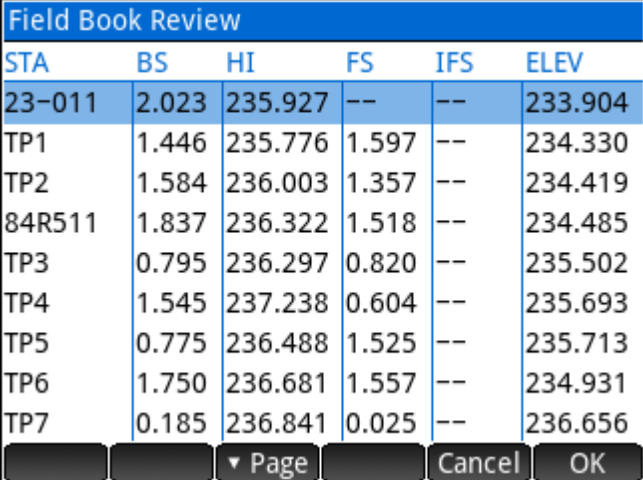

A screenshot of a software menu titled "OBSERVATION DATA". The menu is displayed in a list format with a blue header bar. The options are:

- 1. Field Book Review
- 2. Store Station Elevation
- 3. Export Field Book File
- 4. Export STAR\*NET File

At the bottom of the menu, there are four empty button slots, followed by "Cancel" and "OK" buttons.

## Field Book Review

Displays the observation data like how it would be entered in a field book.

A screenshot of a software window titled "Field Book Review". It displays a table of observation data in a field book format. The table has six columns: STA, BS, HI, FS, IFS, and ELEV. The data is as follows:

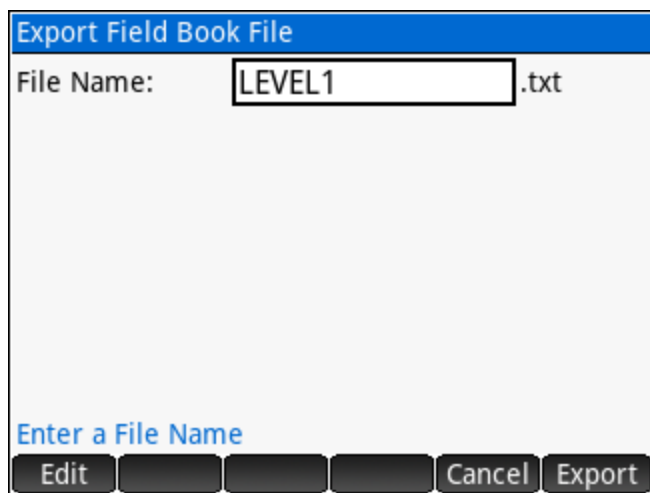

STA	BS	HI	FS	IFS	ELEV
23-011	2.023	235.927	--	--	233.904
TP1	1.446	235.776	1.597	--	234.330
TP2	1.584	236.003	1.357	--	234.419
84R511	1.837	236.322	1.518	--	234.485
TP3	0.795	236.297	0.820	--	235.502
TP4	1.545	237.238	0.604	--	235.693
TP5	0.775	236.488	1.525	--	235.713
TP6	1.750	236.681	1.557	--	234.931
TP7	0.185	236.841	0.025	--	236.656

At the bottom of the table, there are four empty button slots, followed by a "Page" button with a dropdown arrow, and "Cancel" and "OK" buttons.

### Export Field Book File

Export the observation data to a text file, formatted like a Field Book. The fieldbook format of the current project

Four format options are available for order and content of the exported file.

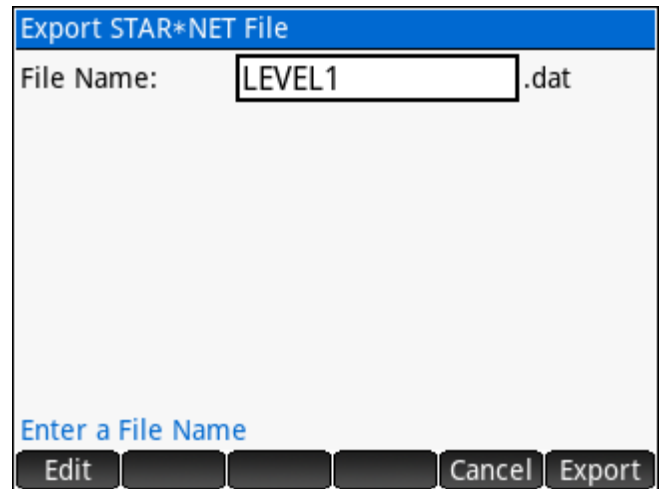

### Sample Output

STA	BS	HI	FS	IFS	ELEV
23-011	2.023	235.927	--	--	233.904
TP1	1.446	235.776	1.597	--	234.330
TP2	1.584	236.003	1.357	--	234.419
84R511	1.837	236.322	1.518	--	234.485
TP3	0.795	236.297	0.820	--	235.502
TP4	1.545	237.238	0.604	--	235.693
TP5	0.775	236.488	1.525	--	235.713
TP6	1.750	236.681	1.557	--	234.931
TP7	0.185	236.841	0.025	--	236.656
TP8	1.720	237.157	1.404	--	235.437
TP9	1.950	237.354	1.753	--	235.404
TP10	0.691	236.318	1.727	--	235.627
TP11	2.078	237.038	1.358	--	234.960
23-013	--	--	1.253	--	235.785

## Export STAR\*NET File

Export the observation data in a STAR\*NET input data format. Any dashes found in station names are replaced with underscore characters to conform with the default STAR\*NET station separator.

The dialog box has a blue title bar that reads "Export STAR\*NET File". Below the title bar, the text "File Name:" is followed by a text input field containing "LEVEL1" and a ".dat" file extension. At the bottom of the dialog, there is a blue link that says "Enter a File Name". Below this link is a row of five buttons: "Edit", an empty button, another empty button, a "Cancel" button, and an "Export" button.

## 8.3 Traverse Plus 3D (BETA)

Traverse Plus 3D in SGS Prime COGO Version 1.5 is released as a BETA. While most of the planned features are included and tested; there are further enhancements planned and more testing required before removing the BETA status. The user is advised to verify results before relying on them.

The primary purpose of this application is to recreate coordinates from field notes or to simulate data collection and field calculation procedures.

Traverse data and settings are specific to the project that is in use. Each project can have its own running traverse, with data and settings saved and restored when closing and opening a project.

A grid of buttons provides access to all functionality of the program, which can also be accessed by using the corresponding numeric key (1-6) on the keyboard.

NOTE: See the [Tools](#) section on available settings to configure, prior to getting started.

### Setup

A valid setup is required before measuring or staking is possible. There are four setup methods:

#### Set Azimuth

**Set Azimuth** is useful for the initial setup of a Traverse when control points do not exist. Generally, the Station will be assigned arbitrary coordinates, and an approximate direction to a second point is entered to get started.

Enter an existing Point ID (which can be created if not yet existing) to set the Station and enter the Instrument Height. The coordinates of the station are displayed (greyed out). Continue to the next screen to enter a direction.

Setup Method: Set Azimuth	
Station ID:	101
Instr Height:	1.617m
Northing:	5368970.195m
Easting:	471985.914m
Elevation:	18.737m
Description:	SPK
Existing Station ID	
Edit	Cancel
Set Az	Cont
Known	Resect
Hlmt	

The Backsight Direction is the only required information to complete the setup. Additional measured information may be entered to calculate the coordinates of the Backsight point, and then optionally store the Backsight Point.

Set Azimuth	
Azimuth	0°00'00"
Measure?	<input type="checkbox"/>
Slope Distance:	0.000m
Zenith Angle:	90°00'00"
Target Height:	0.000m

Azimuth	0°00'00"
Measure?	<input checked="" type="checkbox"/>
Slope Distance:	93.688m
Zenith Angle:	87°46'37"
Target Height:	1.300m
Backsight Direction	
Edit	Cancel Set

### Known Backsight Point

**Known Backsight Point** is a very common type of setup. In this situation the user sets the station over a known point and sets the orientation to another known point.

Enter an existing Point ID (which can be created if not yet existing) to set the Station and enter the Instrument Height. The coordinates of the station are displayed (greyed out). Continue to the next screen to enter the Backsight Point ID.

Enter an existing Point ID for the Backsight to display the calculated direction and distance. Optionally enter the observed direction (to set 0° for example) and the measurements to the Backsight. When measurements are provided, the deltas will be displayed.

Setup Method: Known BS Point	
Station ID:	101
Instr Height:	1.617m

Edit	Cancel Set

Resection

**Resection** involves observing three or more known control points (angles only) to determine the coordinates of the Station. Least squares methods are applied when more than three control points are used. Zenith angles to one or more control points may be observed to determine the elevation of the station.

The example coordinates and directions below will be used to compute the coordinates of Point 569 (2D).

Pt#	Northing	Easting	Direction
570	3127.451	9030.360	180°00'02"
571	3213.971	8947.972	13°18'00"
572	3198.659	8967.350	84°29'40"
573	3189.142	8982.625	144°50'07"

Enter a new Point ID to be used to store the Station coordinates and enter the Instrument Height. Continue to the next screen to add the resection points.

Use the **Add** button on the Resection input screen to add observations to the resection points.

For each resection point; enter the Point ID and the direction to the point. Vertical angles are not observed for this example.

Setup Method: Resection

NOTE: When completing a **Resection** setup; the first point observed will be set as the Backsight Point. The observed direction will be set as the Backsight Direction.

## Resection Helmert

**Resection Helmert** involves observing two or more control points (angles and distances) to compute the least squares best-fit coordinates of the Station.

The example coordinates, slope distances, directions and zenith angles below will be used to compute the coordinates of Point 568 (3D).

Pt#	Northing	Easting	Elevation	Distance	Direction	Zenith
570	3127.451	9030.360	396.190	94.016	180°00'02"	92°34'20"
571	3213.971	8947.972	399.345	26.112	13°18'00"	92°21'00"
572	3198.659	8967.350	398.600	8.474	84°29'40"	102°14'55"
573	3189.142	8982.625	398.610	20.672	144°50'07"	95°00'55"

Enter a new Point ID to be used to store the Station coordinates and enter the Instrument Height. Continue to the next screen to add the resection points.

Use the **Add** button on the Resection input screen to add observations to the resection points.

For each resection point; enter the Point ID, the distance, direction and zenith angle observation to the point. The same target height was used for all observations (1.300m).

The **Set** option on the menu will store the point in the project database and complete the setup.

NOTE: When completing a **Resection Helmert** setup; the first point observed will be set as the Backsight Point. The observed direction will be set as the Backsight Direction.

Measure

The **Measure** option In Traverse Plus 3D is used to calculate coordinates relative to the current Setup; by entering the measured angles and distances. Current settings will affect how information is entered; including:

- 1. **Zenith Angle** and **Target Height** fields are only available in **3D mode**.
- 2. **Azimuth** or **Angle Right** field depends on setting.
- 3. **Slope Distance** or **Horizontal Distance** field depends on setting. **Slope Distance** is only available in **3D mode**.
- 4. When storing the results, the coordinates of the solved position can either be displayed or automatically stored without displaying the coordinates.

Offsets may be applied to the measured values. Offsets are calculated perpendicular and parallel to the line of sight.

- 1. Offset values (positive or negative) can be input from the perspective of viewing either the **Instrument** or the **Target**.
- 2. Offset mode can be set to apply the current offsets to **Next Only** or **Permanent**.

When a point already exists with the same Point ID as the specified Point ID; the option to overwrite or to average the existing and new coordinates is presented.

Tools

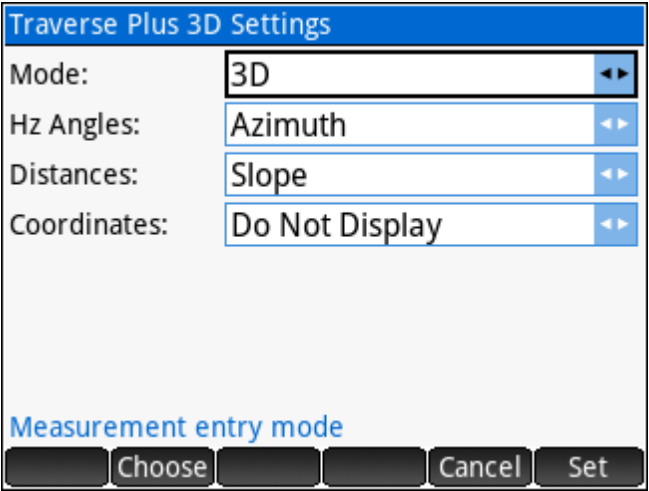

Traverse Plus 3D tools are necessary or handy utilities that are related to the measurment data. Additional tools will be added in a future release.

Configure Settings

Settings make it possible to add flexibility to how Traverse Plus 3D operates.

- ▶ Mode – 2D mode disables zenith angle and target height fields for measurements, and requires horizontal distance measurements. 3D mode enables all fields and allows a choice of entering horizontal or slope distances.
- ▶ Horizontal Angles – Set true Azimuth or Angle Right input for horizontal angles.
- ▶ Distances – Set Slope or Horizontal input for distances. 2D mode only supports horizontal.
- ▶ Coordinates – Within the Measure application this setting determines if the coordinates of the measured point are displayed prior to storing the point.

Inverse Calculations

Opens the Inverse Calculations options to eliminate the need to exit Traverse Plus 3D to calculate inverses.

Close

Closes Traverse Plus 3D and returns to the main menu.

## 8.4 Coordinate Converter

The Coordinate Converter includes the following coordinate conversion capabilities:

1. [Grid↔Geodetic↔Cartesian](#) – Convert between grid coordinates, geodetic coordinates, and cartesian coordinates.
2. [Grid1→Grid2 \(Single Point\)](#) – Convert a coordinate position from one grid projection to another. Input can be grid, geodetic, or cartesian coordinates.
3. [Grid1→Grid2 \(Convert Database\)](#) – Convert points in the project database from one grid projection to another.
4. [Grid↔Ground \(Single Point\)](#) – Convert coordinates of a single point between grid and ground based on supplied parameters.
5. [Grid↔Ground \(Convert Database\)](#) – Convert points in the database between grid and ground based on supplied parameters.

### Grid↔Geodetic↔Cartesian

Convert between grid coordinates, geodetic coordinates, and cartesian coordinates using the current [Coordinate System](#) settings. Input can be grid coordinates (N,E,h), geodetic coordinates ( $\Phi,\lambda,h$ ), cartesian coordinates (x,y,z), or grid coordinates from a point in the database.

Results include all three coordinate representations, the point grid/elevation/combined factors, and the grid convergence angle at the point.

## Grid1→Grid2 (Single Point)

Convert a coordinate position from one grid projection to another. Both grid projections, the transformation method and the transformations parameters are selected prior to calculation. Available transformation methods include:

- **No Transformation** – Generally if both grid projections are based on the same ellipsoid, then no transformation is required.
- **Dual Step (via WGS84)** – When an intermediate reference frame is required to convert to and from. Frequently the transformation parameters are known to convert to WGS84, in this case the user **MUST** define the transformation parameters for both **Transform 1** and **Transform 2** to be **TOWGS84**. The first step transforms to WGS84 with the supplied parameters directly, the second step transforms from WGS84 by changing the signs of the transformation parameters. This is done to eliminate the need to have two sets of transformation parameters for typical use. See the [Transformation Parameters](#) section for more information.
- **Single Step (Direct)** – When the transformation parameters to convert directly from one reference frame to another are known.

Input can be grid coordinates (N,E,h), or grid coordinates from a point in the database. The vertical system from the [Coordinate System](#) settings is used for height entry. See elevations note next page.

The results include the position of the point in the second projection, the point grid/elevation/combined factors, the grid convergence angle at the point, and the geodetic coordinates of the point.

NOTE: When using transformations to transform points between projections based on different ellipsoids, the [Vertical System](#) should be set to [Ellipsoidal](#) to obtain meaningful height results.

## Grid1→Grid2 (Convert Database)

Convert points in the project database from one grid projection to another. Both grid projections, the transformation method and the transformations parameters are selected prior to calculation. See [previous section](#) for more information on available transformation methods.

Next, enter the point range to convert the coordinates in the database and specify how to store the new coordinates.

## Transformation Parameters

A default **NULL** transformation is included, it does nothing but can be useful in some cases. All other transformations can be defined as 3 or 7 parameter transformations. The menu can be used to create new transformations and edit or delete existing ones. Other types of transformations:

- ▶ **Bursa/Wolf** – Use the 7 Parameter in lieu of.
- ▶ **4 Parameter** – Use the 7 Parameter and set the 3 rotations to zero.
- ▶ **6 Parameter** – Use the 7 Parameter and set the scale parameter to zero.
- ▶ **Molodensky** – Use the 3 Parameter in lieu of.

Grid↔Ground (Single Point)

Land surveyors will often work with “ground-level” coordinates to eliminate the need to correct for a scale factor for distance/area/volume calculations; but for various reasons they also require the “geo-referenced” grid positions of their coordinates for other purposes. The grid/ground conversion tool is created to make the conversion from one to the other a simple task for any/all points in a project.

The parameters are defined and stored separately for each project and include:

1. A base point from which any scaling and rotation is done. This can be set to the coordinate system origin 0,0,0.

2. The base point horizontal coordinates in the converted system (ground or grid). This can often be a common point with the same coordinates in both grid and ground, in which case the *Use Base* option applies. The shift is calculated between the base point and the given coordinates.

3. The base point elevation in the converted system (ground or grid). The shift is calculated between the base point and the given elevation.

4. The scale factor to scale the horizontal coordinates from the base point.

5. The scaling method, either multiply or divide by the given scale factor.

6. The rotation angle to rotate from the base point.

## 8.5 Ellipsoid Calculations

DIRECT and INVERSE Computations on the ellipsoid are implemented using Vincenty's equations.

Position input for both types of calculations can be grid coordinates (N,E,h), geodetic coordinates ( $\Phi,\lambda,h$ ), cartesian coordinates (x,y,z), or grid coordinates from a point in the database.

ELLIPSOID CALCULATIONS

1. DIRECT Computation

2. INVERSE Computation

### DIRECT Computation

Enter the position of the first point in any of the available formats and provide the forward azimuth and ellipsoidal distance to the second point.

The solution shows:

- ▶ The grid coordinates of the second point, the grid direction and grid distance to the second point
- ▶ The geodetic coordinates of the second point and the back azimuth.
- ▶ The cartesian coordinates of the second point.

## INVERSE Computation

Enter the positions of two points in any of the available formats

The solution shows:

- ▶ The grid direction, grid distance, the average combined factor and the ground distance between the two points.
- ▶ The ellipsoid distance, the forward and back azimuths between the two points.
- ▶ The cartesian deltas, and the 3D point to point vector length.

# Appendix A

The table below includes the parameters used for the ellipsoid definitions in **SGS Prime COGO**.

$$b = a \times (1 - f)$$

$$e' = \sqrt{\frac{a^2 - b^2}{a^2}}$$

$$f = (a - b) \div a$$

$$e'' = \sqrt{\frac{a^2 - b^2}{b^2}}$$
